## The sign problem

The QCD partition function:

$$
\begin{aligned}
Z(V, T, \mu) & =\int \mathcal{D} U \mathcal{D} \psi \mathcal{D} \bar{\psi} e^{-S_{F}(U, \psi, \bar{\psi})-\beta S_{G}(U)} \\
& =\int \mathcal{D} U \operatorname{det} M(U) e^{-\beta S_{G}(U)}
\end{aligned}
$$

- For Monte Carlo simulations det $M(U) e^{-\beta S_{\sigma}(U)}$ is interpreted as Boltzmann weight
- If there is particle-antiparticle-symmetry $\operatorname{det} M(U)$ is real
- If $\mu^{2}>0 \operatorname{det} M(U)$ is complex

## Dealing with the sign problem

(3) Results at $n_{S}=0$ and $\mu_{Q}=0$

4 Beyond strangeness neutrality

## Strangeness Neutrality

Enforcing the conditions $\mu_{Q}=0$ and $\chi_{1}^{S}=0$ :

$$
\frac{\mathrm{d} \mu_{S}}{\mathrm{~d} \mu_{B}}=-\frac{\chi_{11}^{B S}}{\chi_{2}^{S}} .
$$

On this line, total derivatives with respect to the baryochemical potential read

$$
\frac{\mathrm{d}}{\mathrm{~d} \hat{\mu}_{B}}=\frac{\partial}{\partial \hat{\mu}_{B}}+\frac{\mathrm{d} \hat{\mu}_{S}}{\mathrm{~d} \hat{\mu}_{B}} \frac{\partial}{\partial \hat{\mu}_{S}}=\frac{\partial}{\partial \hat{\mu}_{B}}-\frac{\chi_{11}^{B S}}{\chi_{2}^{S}} \frac{\partial}{\partial \hat{\mu}_{S}} .
$$

For the pressure we get:

$$
\left.c_{n}^{B}\left(T, \hat{\mu}_{B}\right) \equiv \frac{\mathrm{d}^{n} \hat{p}\left(T, \hat{\mu}_{B}\right)}{\mathrm{d} \hat{\mu}_{B}^{n}}\right|_{\substack{\mu_{Q}=0 \\ \chi_{1}^{s}=0}}
$$

The net baryon density is given by:

$$
c_{1}^{B}\left(T, \hat{\mu}_{B}\right)=\chi_{1}^{B}-\frac{\chi_{11}^{B S}}{\chi_{2}^{S}} \chi_{1}^{S}=\chi_{1}^{B}
$$

This rescaling will break down at large $T \longrightarrow$ rescaling with SBL

This rescaling will break down at large $T \longrightarrow$ rescaling with SBL

## Why does the rescaling work?

- It is an observation that it works
- It could be related to the critical scaling in the chiral limit
- If the universal contribution to EoS is large $\rightarrow$ single scaling variable
- If strength of transition is strongly Influenced by light quark masses $\rightarrow$ curves keep there shape
- Fits with the observation of constant width of the transition

[Borsanyi:2020fev]

## Measuring the shift

$c_{1}^{B}$ : net baryon density
$\overline{c_{1}^{B}}$ : SBL of net baryon density

$$
\Pi\left(T, \hat{\mu}_{B}, N_{\tau}\right)=\frac{T^{\prime}\left(T, \hat{\mu}_{B}, N\right)-T}{T \hat{\mu}_{B}}
$$

## Measuring the shift

$c_{1}^{B}$ : net baryon density
$\overline{c_{1}^{B}}$ : SBL of net baryon density

$$
\Pi\left(T, \hat{\mu}_{B}, N_{\tau}\right)=\frac{T^{\prime}\left(T, \hat{\mu}_{B}, N\right)-T}{T \hat{\mu}_{B}}
$$

## Measuring the shift

$c_{1}^{B}$ : net baryon density
$\overline{c_{1}^{B}}$ : SBL of net baryon density

$$
\Pi\left(T, \hat{\mu}_{B}, N_{\tau}\right)=\frac{T^{\prime}\left(T, \hat{\mu}_{B}, N\right)-T}{T \hat{\mu}_{B}}
$$

## Measuring the shift

\Pi\left(T, \hat{\mu}_{B}, N_{\tau}\right)=\frac{T^{\prime}\left(T, \hat{\mu}_{B}, N\right)-T}{T \hat{\mu}_{B}}
$$

## Lattice Setup

- Action: tree-level Symanzik improved gauge action, with four times stout smeared staggered fermions
- $2+1+1$ flavour, on LCP with pion and kaon mass
- Simulation at $\left\langle n_{S}\right\rangle=0$
- Continuum estimate from lattice sizes: $32^{3} \times 8,40^{3} \times 10,48^{3} \times 12$ and $64^{3} \times 16$
- $\frac{\mu_{B}}{T}=\mathrm{i} \frac{j \pi}{8}$ with $j=0,3,4,5,(5.5), 6$ and 6.5
- Two methods of scale setting: $f_{\pi}$ and $w_{0}$, $L m_{\pi}>4$

## Systematic Errors

- 3 different sets of spline node points at $\mu_{B}=0$
- 2 different sets of spline node points at finite imaginary $\mu_{B}$
- $w_{0}$ or $f_{\pi}$ based scale setting
- 2 different chemical potential ranges in the global fit: $\hat{\mu}_{B} \leq 5.5$ or $\hat{\mu}_{B} \leq 6.5$
- 2 functions for the chemical potential dependence of the global fit: linear or parabola
- including the coarsest lattice, $N_{\tau}=8$, or not, in the continuum extrapolation.

In total we perform 96 Fits. We weight every result with a $Q>0.01$ uniformly

## The expansion coefficients

$$
\begin{aligned}
& \Pi\left(T, \hat{\mu}_{B}, N_{\tau}\right)=\frac{T^{\prime}\left(T, \hat{\mu}_{B}, N\right)-T}{T \hat{\mu}_{B}} \\
& \Pi\left(T, \hat{\mu}_{B}, N_{\tau}\right)=\lambda_{2}^{A}+\lambda_{4}^{A} \hat{\mu}_{B}^{2}+\lambda_{6}^{A} \hat{\mu}_{B}^{4} \\
& +\frac{1}{N_{\tau}^{2}}\left(\alpha^{A}+\beta^{A} \hat{\mu}_{B}^{2}+\gamma^{A} \hat{\mu}_{B}^{4}\right)
\end{aligned}
$$

We make a fit to calculate derivatives and constrain it with the HRG.Analytic continuation and the equation of stateRescaling and expansion - the analysis
(3) Results at $n_{S}=0$ and $\mu_{Q}=0$Beyond strangeness neutrality

## Thermodynamics

$$
\frac{p\left(T, \hat{\mu}_{B}\right)}{T^{4}}=\frac{p(T, 0)}{T^{4}}+\int_{0}^{\hat{\mu}_{B}} c_{1}^{B}\left(T, \hat{\mu}_{B}^{\prime}\right) \mathrm{d} \hat{\mu}_{B}^{\prime},
$$

with

$$
c_{1}^{B}\left(T, \hat{\mu}_{B}\right)=c_{2}^{B}\left(T^{\prime}, 0\right) \frac{\overline{c_{1}^{B}}\left(\hat{\mu}_{B}\right)}{\overline{c_{2}^{B}}(0)},
$$

and $\frac{p(T, 0)}{T^{4}}$ from [Borsanyi:2013bia] The entropy density is defined as $s=\left.\frac{\partial \rho}{\partial T}\right|_{\mu_{B}, \mu_{S}}$, which can be rewritten in terms of dimensionless quantities as:

$$
\hat{s}=4 \hat{p}+\left.T \frac{\partial \hat{p}}{\partial T}\right|_{\mu_{B}}=4 \hat{p}+\left.T \frac{\partial \hat{p}}{\partial T}\right|_{\hat{\mu}_{B}}-\hat{\mu}_{B} \chi_{1}^{B},
$$

where $\hat{s} \equiv \frac{s}{T^{3}}$ and we took into account the difference between derivatives at fixed $\mu_{B}$ versus at fixed $\hat{\mu}_{B}$.

## Thermodynamics II

By noticing that on the strangeness neutral line

$$
\frac{\mathrm{d} \hat{p}\left(T, \hat{\mu}_{B}, \hat{\mu}_{S}\left(T, \hat{\mu}_{B}\right)\right)}{\mathrm{d} T}=\chi_{1}^{S} \frac{\partial \hat{\mu}_{S}}{\partial T}+\frac{\partial \hat{p}}{\partial T}=\frac{\partial \hat{p}\left(T, \hat{\mu}_{B}, \hat{\mu}_{S}\left(T, \hat{\mu}_{B}\right)\right)}{\partial T},
$$

we can write the logarithmic temperature derivative of the pressure as:

$$
\begin{aligned}
& \left.T \frac{\partial \hat{p}\left(T, \hat{\mu}_{B}\right)}{\partial T}\right|_{\hat{\mu}}=T \frac{\partial \hat{p}(T, 0)}{\partial T} \\
+ & \left.\frac{1}{2} \int_{0}^{\hat{\mu}_{B}^{2}} T \frac{\mathrm{~d} c_{2}^{B}\left(T^{\prime}, 0\right)}{\mathrm{d} T^{\prime}}\right|_{T^{\prime}} \times\left[1+\lambda_{2}^{B B} y+\lambda_{4}^{B B} y^{2}+T\left(\frac{\mathrm{~d} \lambda_{2}^{B B}}{d T} y+\frac{\mathrm{d} \lambda_{4}^{B B}}{d T} y^{2}\right)\right] d y
\end{aligned}
$$

where $\frac{\mathrm{d}_{2}^{B}(T)}{\mathrm{d} T}$ is calculated at $\mu_{B}=0$ and $T^{\prime}=T\left(1+\lambda_{2}^{B B} y+\lambda_{4}^{B B} y^{2}\right)$
Given the pressure and the entropy, the dimensionless energy density is given by:

$$
\hat{\epsilon}=\hat{s}-\hat{p}+\hat{\mu}_{B} \chi_{1}^{B},
$$

where $\hat{\epsilon}=\frac{\epsilon}{T^{4}}$.

## Results at $n_{S}=0$ and $\mu_{Q}=0$ I

(3) Results at $n_{S}=0$ and $\mu_{Q}=0$

4 Beyond strangeness neutrality

## More strangeness

Two more observables:

## More strangeness

Two more expansion:

## Beyond strangeness neutrality

$$
\Delta \hat{\mu}_{S} \equiv \hat{\mu}_{S}-\hat{\mu}_{S}^{\star},
$$

the dimensionless strangeness and baryon densities become:

$$
\begin{aligned}
& \chi_{1}^{S}\left(\hat{\mu}_{S}\right) \approx \chi_{2}^{S}\left(\hat{\mu}_{S}^{\star}\right) \Delta \hat{\mu}_{S} \\
& \chi_{1}^{B}\left(\hat{\mu}_{S}\right) \approx \chi_{1}^{B}\left(\hat{\mu}_{S}^{\star}\right)+\chi_{11}^{B S}\left(\hat{\mu}_{S}^{\star}\right) \Delta \hat{\mu}_{S}
\end{aligned}
$$

where we only kept the linear leading order terms in $\Delta \hat{\mu}_{S}$. We will express thermodynamic quantities in terms of the strangeness-to-baryon fraction:

$$
R=\frac{\chi_{1}^{S}}{\chi_{1}^{B}}=\frac{\chi_{2}^{S}\left(\hat{\mu}_{S}^{\star}\right) \Delta \hat{\mu}_{S}}{\chi_{1}^{B}\left(\hat{\mu}_{S}^{\star}\right) \Delta \hat{\mu}_{S}+\chi_{11}^{B S}\left(\hat{\mu}_{S}^{\star}\right)} .
$$

Inverting this equation we get:

$$
\Delta \hat{\mu}_{S}=\frac{R \hat{\chi}_{1}^{B}\left(\hat{\mu}_{S}^{\star}\right)}{\chi_{2}^{S}\left(\hat{\mu}_{S}^{\star}\right)-R \chi_{11}^{B S}\left(\hat{\mu}_{S}^{\star}\right)} .
$$

## Beyond strangeness neutrality

$$
\begin{gathered}
R=\frac{\chi_{1}^{S}}{\chi_{1}^{B}} \\
\Delta \hat{\mu}_{S}=\frac{R \hat{\chi}_{1}^{B}\left(\hat{\mu}_{S}^{\star}\right)}{\chi_{2}^{S}\left(\hat{\mu}_{S}^{\star}\right)-R \chi_{11}^{B S}\left(\hat{\mu}_{S}^{\star}\right)}
\end{gathered}
$$

## Strange Baryon density

Expanding the baryon density:

$$
\begin{aligned}
& \frac{\chi_{1}^{B}\left(T, \hat{\mu}_{B}, R\right)}{\chi_{1}^{B}\left(T, \hat{\mu}_{B}, R=0\right)} \\
& \approx 1+R \frac{\chi_{11}^{B S}\left(T, \hat{\mu}_{B}, R=0\right)}{\chi_{2}^{S}\left(T, \hat{\mu}_{B}, R=0\right)}
\end{aligned}
$$

where all quantities on the right hand side are along the strangeness neutral line.

## Strange Pressure

At the strangeness neutral line the $\mathcal{O}(R)$ correction of the pressure vanishes. The leading order correction gives:

$$
\begin{aligned}
\hat{p}\left(T, \hat{\mu}_{B}, R\right) & \approx \hat{p}\left(T, \hat{\mu}_{B}, R\right) \\
& +\frac{1}{2} \frac{\mathrm{~d}^{2} \hat{p}}{\mathrm{~d} R^{2}}\left(T, \hat{\mu}_{B}\right) R^{2}
\end{aligned}
$$

where

$$
\frac{\mathrm{d}^{2} \hat{p}}{\mathrm{~d} R^{2}}\left(T, \hat{\mu}_{B}\right)=\frac{\left(\chi_{1}^{B}\left(T, \hat{\mu}_{B}\right)\right)^{2}}{\chi_{2}^{S}\left(T, \hat{\mu}_{B}\right)}
$$

## Summary

$\kappa$ vs. $\lambda$
