

Getting ready for the LHC

Günther Dissertori
ETH Zürich

Galileo-Galilei Institute
Firenze
16.6.2006

Outline

- Introduction
- **Now** : Status of the
 - Machine
 - Detectors
- **Pretty soon** : Commissioning and start-up scenarios of the
 - Machine
 - Detectors
- **Soon**
 - Pilot and first Physics run
- **Further aspects**
 - Learn a map from the data
 - Some comments

What I will (not) offer here:

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors

First Physics

Comments

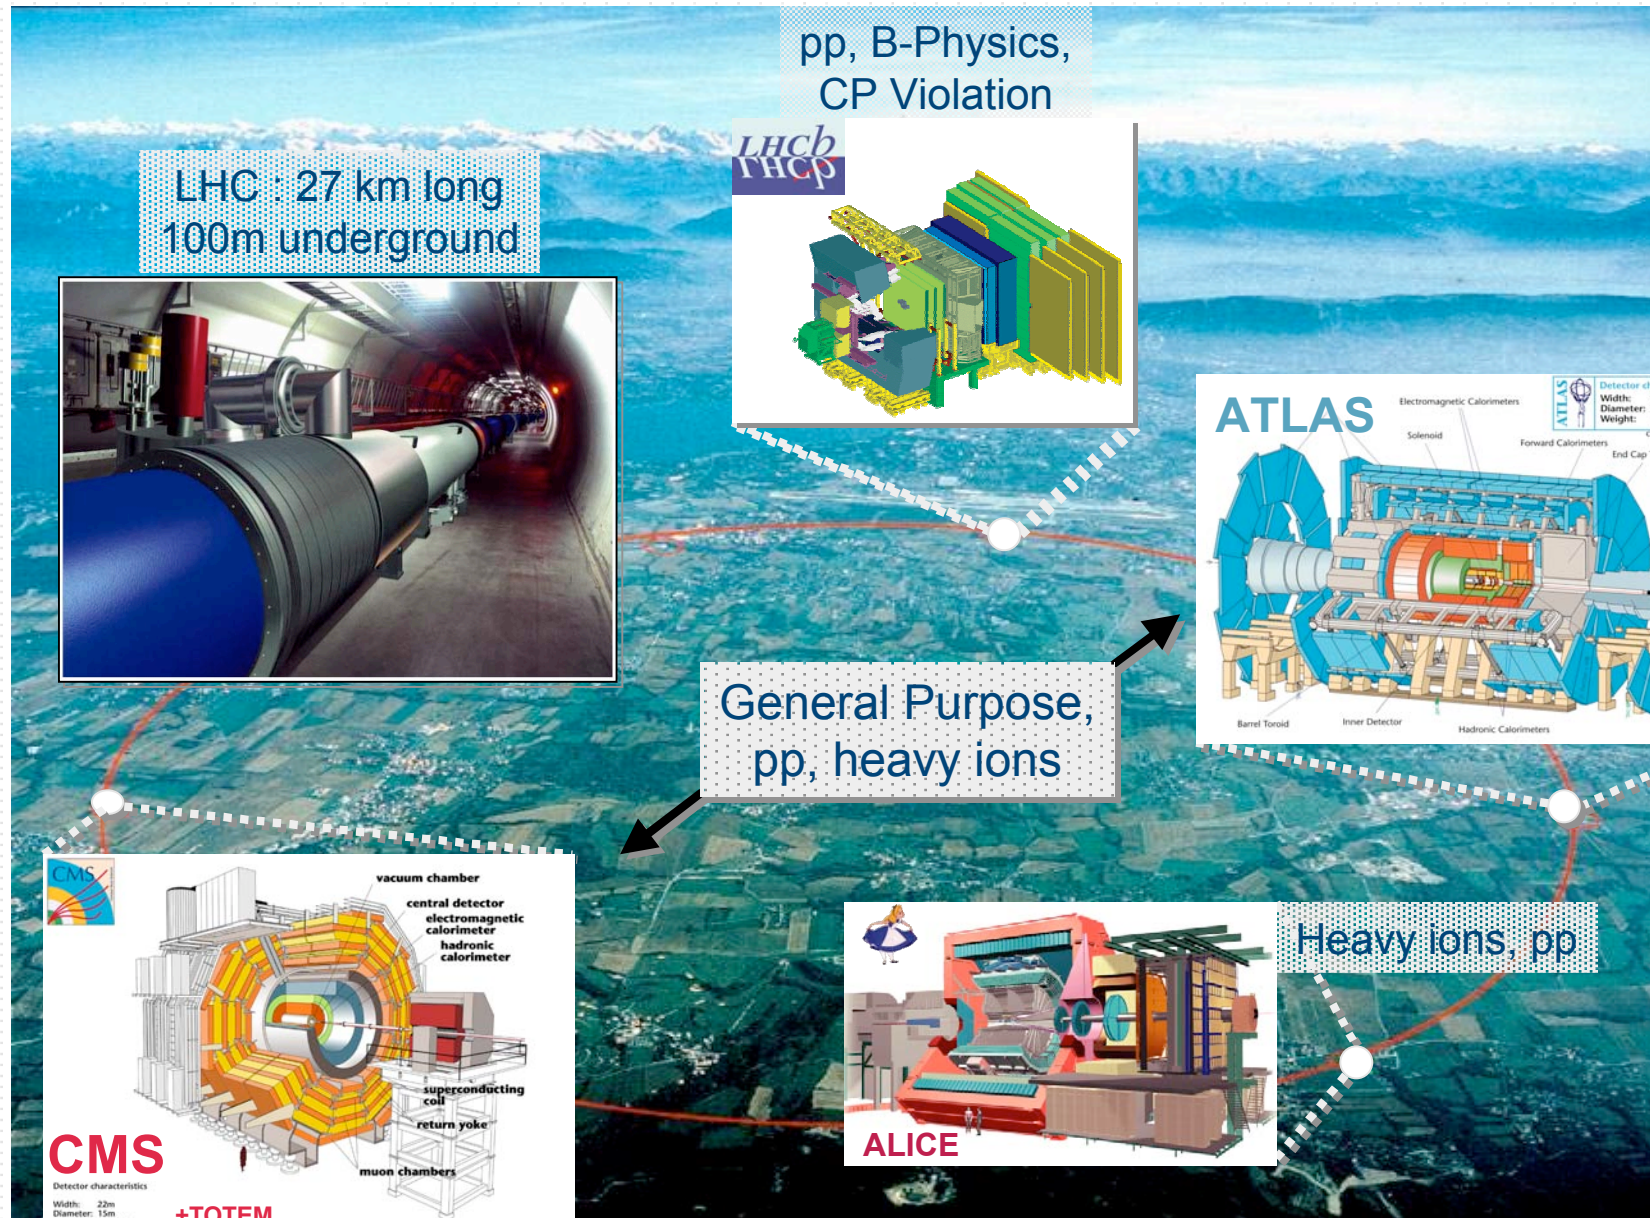

- I **will talk** about
 - A very brief overview of the **hardware preparations** of
 - the machine
 - ATLAS and CMS
 - Explain the **startup**
 - Why is the LHC startup planned in this particular way?
 - What are the initial challenges for the detectors
 - **Pilot run** and first year
 - What can we do with pilot run data?
 - First the first year's data
 - Some **comments** about
 - Use of data to constrain backgrounds, MCs
 - Use of MCs
- I **will not talk** about
 - LHCb and ALICE (sorry for that...)
 - All the wonderful physics we can do (from NNMSSM to Black Holes)
 - All the details of Higgs and SUSY searches
 - Data challenges, Data flow, ATLAS Blind test

Our future play ground

CMS closed for Magnet test in the SX5 surface building (April/May 2006)

- Check functionality of all magnet systems
- Map the magnetic field
- Check installation & cabling of
 - ECAL/HCAL/Tracker inside coil
- Test combined sub-detectors in 20 degree slice(s) of CMS with Magnet. Try out operation procedures for CMS (24/7 running)

we shall never begin.” (Ivan Turgenev)*

LHC : Performance Limitations

- Introduction
- Status of Machine
- Detectors
- Startup of Machine
- Machine**
- Detectors
- First Physics
- Comments

Parameter/Effects	Limitations
Beam energy limited by maximum dipole field. Industrially available technology.	7 TeV
Bunch and total beam intensity beam-beam effect (tune spread), small allowed space in Q-space, collimators (impedance, collective instabilities), electron cloud, radiation	$N < 1.7 \cdot 10^{11}$ $N_{\text{nom}} = 1.15 \cdot 10^{11}$ $I < 0.85 \text{ A}$
Normalized emittance Basically given by injector chain and limited by main dipole aperture	$\epsilon_n < 3.75 \mu\text{m}$
Beam size at IP (β^*) Limited by (triplet) quadrupole aperture	$\beta^* > 0.55 \text{ m}$ $\sigma \sim 16 \mu\text{m}$
Number of bunches Limited by stored beam energy, electron cloud eff.	2808
Operation efficiency and L_{int} minimize quenches and beam aborts, collimators and cleaning important: $N_{\text{lost}} < 7 \cdot 10^8 / \text{m} = 2.2 \cdot 10^{-6} N$	Total beam intensity

Legend:

- N : particles/bunch
- n : nr. of bunches
- I : current / beam
- $\epsilon_n = \epsilon \gamma$, ϵ : emittance
- β^* : β at IP
- Beam size $\sigma^2 = \beta \epsilon$
- Q : tune (number of trans. oscil./turn)
- Tune spread $\Delta Q \propto N / \epsilon_n$

$$\mathcal{L} = \frac{N^2 n f_{\text{rev}}}{4\pi \epsilon_n \beta^*}$$

LHC : Performance Limitations

Current in machine

$$\mathcal{L} = \frac{N^2 n f_{\text{rev}}}{4\pi \epsilon_n \beta^*}$$

Luminosity

Beam size

N : particles/bunch

n : nr. of bunches

I : current / beam

$\epsilon_n = \epsilon_x \epsilon_y$, ϵ : emittance

β^* : β at IP

Beam size $\sigma^2 = \beta \epsilon$

Q : tune (number of trans. oscil./turn)

Tune spread
 $\Delta Q \propto N / \epsilon_n$

LHC : Performance Limitations

- Introduction
- Status of
- Machine
- Detectors
- Startup of
- Machine**
- Detectors
- First Physics
- Comments

■ Two Examples: Magnet aperture, beam-beam, collimators

Relative beam sizes around IP1 (Atlas) in collision

$$\sigma^* = 16.6 \mu\text{m} \xrightarrow{\sim 23\text{m}} \sigma(\text{triplet}) = 1.54 \text{ mm}$$

Badly conducting collimators : large wake fields : instability

Phase 1 : graphite (robust), $I < 0.3 \text{ A}$

Phase 2 : Cu (good conduct.) $I < 0.85 \text{ A}$

LHC : Start-up scenario

- Introduction
- Status of
- Machine
- Detectors
- Startup of
- Machine**
- Detectors
- First Physics
- Comments

Stage 1
 Initial commissioning
 43x43 to 156x156, $N=3 \times 10^{10}$
 Zero to partial squeeze

$$L=3 \times 10^{28} - 2 \times 10^{31}$$

Stage 2
 75 ns operation
 936x936, $N=3-4 \times 10^{10}$
 partial squeeze

$$L=10^{32} - 4 \times 10^{32}$$

Stage 3
 25 ns operation
 2808x2808, $N=3-5 \times 10^{10}$
 partial to near full squeeze

$$L=7 \times 10^{32} - 2 \times 10^{33}$$

Stage 4
 25 ns operation
 Push to nominal per bunch
 partial to full squeeze

$$L=10^{34}$$

- **Objective** : establish colliding beams as quickly as possible, safely, without compromising further progress
- Take two moderate intensity multi-bunch beams to high energy and collide them : minimize problems due to electron cloud, event pile-up, equipment restrictions, use phase 1 collimators.

Detector Commissioning

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors

First Physics

Comments

- Construction quality checks and beam tests of series detector modules show that the **detectors as built should give a good starting-point performance**
- However, a lot of data (**and time ...**) will be needed at the beginning to
 - Commission the detector and trigger **in situ**
 - Reach the performance needed to optimize the physics potential
 - Understand **“basic” physics at 14 TeV** and normalize (tune) the MC generators
 - Measure backgrounds to new physics and extract **“early” convincing signals**
- **Efficient/extensive/robust commissioning programme** with physics data is therefore crucial to reach quickly the **“discovery” mode**

Detectors : Commissioning

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors

First Physics

Comments

■ No Beam :

■ Cosmic Muons

■ Initial alignment/detector calibration (barrel)

■ Debugging, dead-channels mapping

■ Rates :

- $E_{\text{surface}} > 10 \text{ GeV}$: $\sim 1 - 5 \text{ kHz}$
- useful for calibration : $\sim 0.5 \text{ Hz}$

■ One Beam :

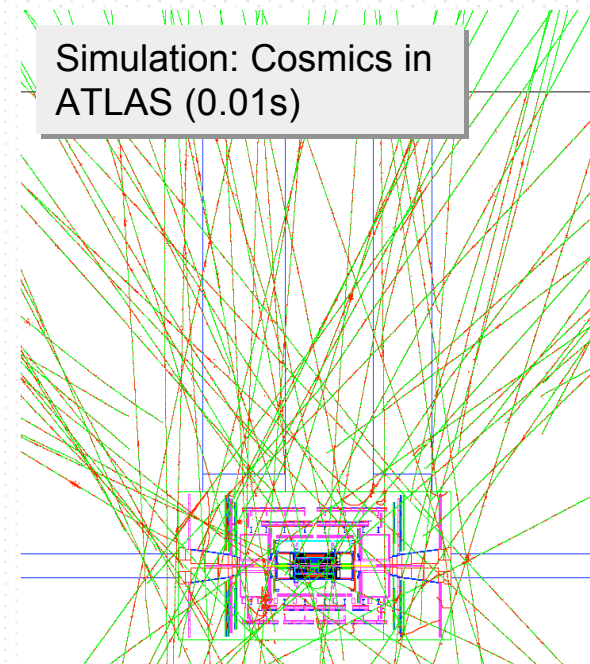

■ Beam-Halo Muons

- Alignment/calibration in end-caps
- Rate for $E > 100 \text{ GeV}$: $\sim 1 \text{ kHz}$

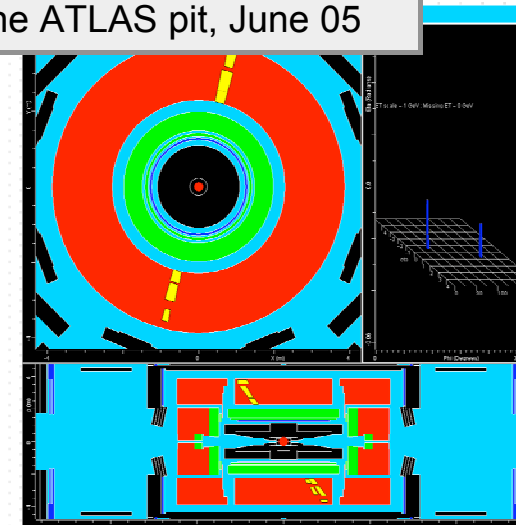

■ Beam-Gas events

- resemble pp, with soft spectrum ($p_T < 2 \text{ GeV}$)
- 25 Hz of reco. Tracks with $p_T > 1 \text{ GeV}$, $|z| < 20 \text{ cm}$
- eg. first alignment of inner trackers to about $100 \mu\text{m}$ or better?

Simulation: Cosmics in

the ATLAS pit, June 05

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

Soon : Pilot Run and First Physics

“The only place you’ll find SUCCESS before WORK is in the dictionary” (May B. Smith)

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

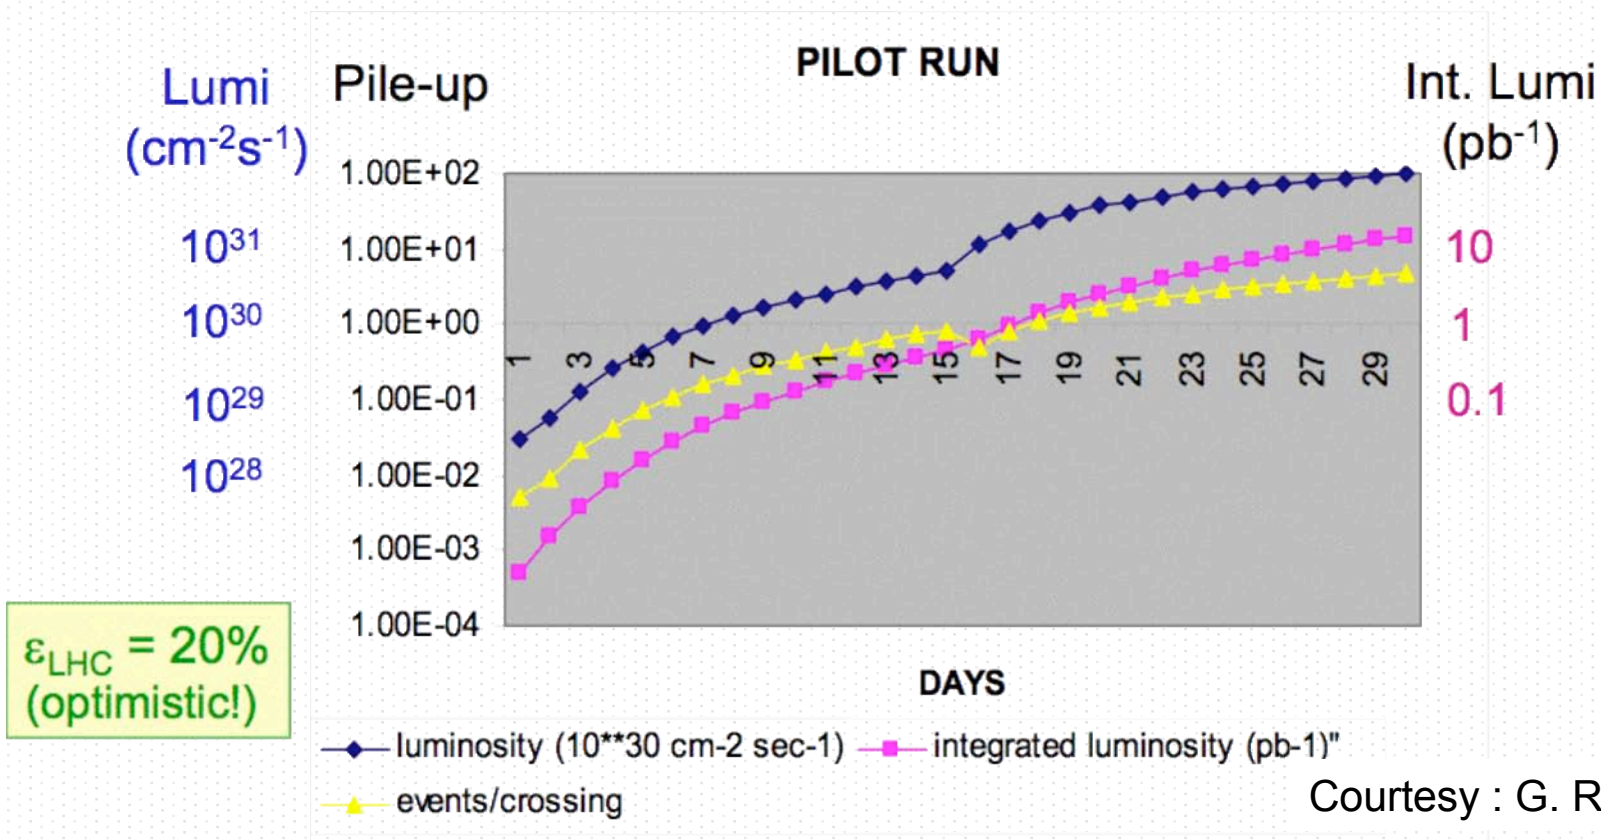

- The first time that we will see proton-proton collisions at 14 TeV !
- Pilot run is short (max 30 days) and data taking will happen only for a small fraction of time
- Important to **use very efficiently** this time optimizing between competing tasks
 - Changing conditions to commission the detector (eg. synchronization)
 - Stable data taking for tracker alignment & measurement of minimum bias (can be done with coarse synchronization)

Pilot run : Luminosity

- Introduction
- Status of
- Machine
- Detectors
- Startup of
- Machine
- Detectors.
- First Physics**
- Comments

- 30 days maximum, probably less (?)
- 43x43 bunches, then 156x156 bunches

Courtesy : G. Rolandi

Pilot Run : Number of events

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

Courtesy G. Rolandi

Assumed efficiencies:

$$\epsilon(\text{jets}) = 100\%$$

$$\epsilon(W) = 20\%$$

$$\epsilon(Z) = 20\%$$

$$\epsilon(\text{ttbar}) = 1.5\%$$

Even within a few hours/days:

- ✓ About 10 million minimum bias evts (almost possible to trigger randomly)
- A few million di-jet events with $E_T > 15$ GeV
- Not much of anything else

Pile-Up

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

- **Pile-up** : additional mostly soft-interactions per bunch crossing
- Start-up Lumi : $2 \times 10^{33} \text{ cm}^{-2}\text{s}^{-1} \Rightarrow 4 \text{ events}$ / bunch crossing
- High Lumi : $10^{34} \text{ cm}^{-2}\text{s}^{-1} \Rightarrow 20 \text{ events}$ / bunch crossing

LHC event - no pile-up

LHC event - $10^{34} \text{ cm}^{-2}\text{s}^{-1}$

Courtesy A. De Roeck

The Underlying Event

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

The Underlying Event:

beam-beam remnants
initial-state radiation
multiple-parton
interactions

Issues:

β modeling (learn from min. bias)

β extrapolation to LHC energies

β impact on selection efficiencies ?

- isolation, trigger strategy

β have to tune MCs (eg. Pythia) asap

Modeling of the Underlying Event

Introduction

Status of

Machine

Detectors

Startup of

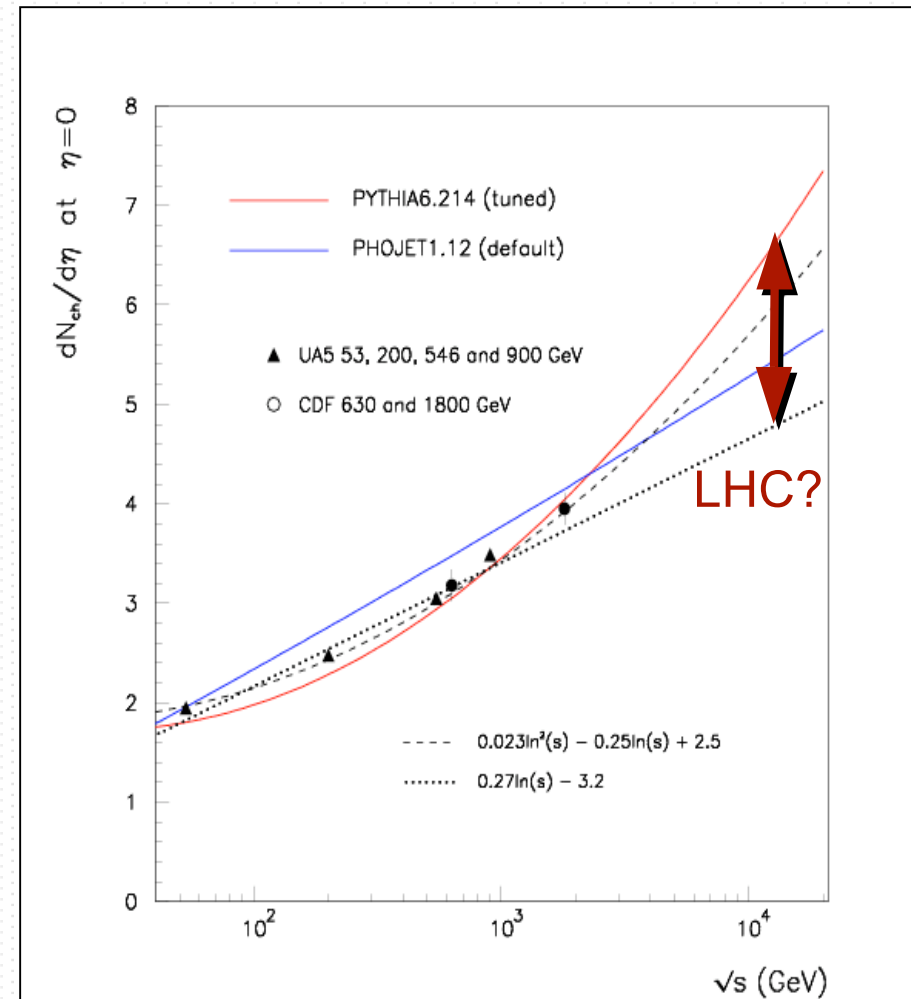

Machine

Detectors.

First Physics

Comments

- ~12 particles/evt in the barrel (+12 forward)
- Half of them curl in the tracker, ~50% reach outermost tracker layer

Di-Jets

Introduction

Status of

Machine

Detectors

Startup of

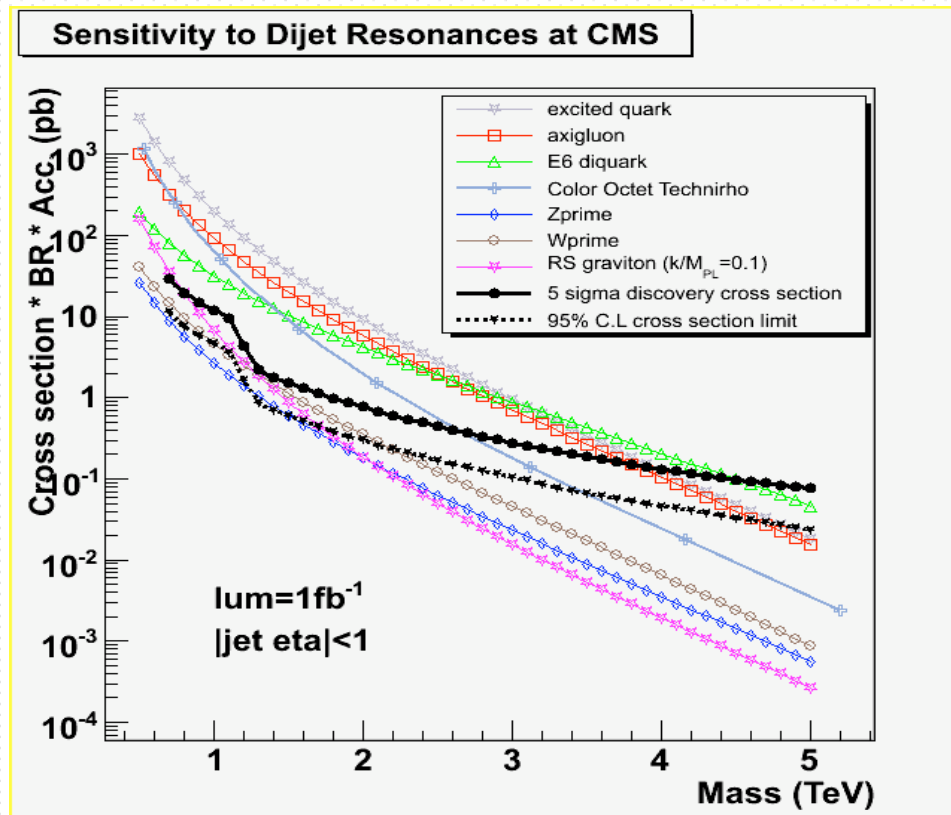

Machine

Detectors

First Physics

Comments

- Produced at high rate
- Use for jet calibration by balancing jet transverse momentum
 - analyse ($\Delta p_T / \text{di-jet } p_T$) . Works well for low p_T , but low stat. at high p_T
- Physics interest in the high mass tail

- QCD cross section between 1.9 - 2.1 TeV is 3.5 pb
- Excited quarks : 8 pb !
- CDF/D0 limits in the range 0.4 - 1 TeV
- With 15 pb⁻¹ at 14 TeV we could extend this
- Crucial: energy resolution in measuring jet energy (narrow resonances)

But ... if we see a signal .. How can we be sure about the tails in the energy resolution?

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors

First Physics

Comments

- **Simulate 10 million min. bias evts and 1 million di-jets** with $p_T^{\text{had}} > 10\text{-}15$ GeV, using pilot run geometry
 - No pixel det., no ECAL endcaps
- **Reconstruct** these evts with latest reconstruction software
- “collect” the events
 - I.e. determine with which **rate** these events can be handled by the **initial DAQ** config.
 - Determine a **trigger strategy** to saturate it
 - Random, ECAL low energy photons, HCAL low thresholds, muons
 - Study trigger conditions as function of increasing luminosity

see CMS Physics TDR due this year !!

First Physics runs (2008...)

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors

First Physics

Comments

- **After first “good” 10 pb⁻¹**
 - ~20000 W, decaying to lepton + neutrinos
 - ~2500 Z, decaying into two leptons
 - ~200 semi-leptonic top-pair events
 - Measure rates, align and calibrate better

- **After first “good” 100 pb⁻¹**
 - W(Z)+jets rates well measurable
 - Jet calibration, MET calibration (for SUSY)
 - Inclusive leptons, di-leptons, photons, di-photon triggers (for Higgs)

- **From 100 pb⁻¹ to 1 fb⁻¹**
 - **Standard model candles**
 - Top pair prod., W/Z cross sections, PDF studies, QCD studies, b-jet production
 - Do extensive MC tuning
 - **Early Higgs boson search**
 - $H \rightarrow \gamma\gamma, WW, ZZ$
 - **Early SUSY-BSM searches**
 - MET + anything, di-jet, di-leptons, di-photon, resonances....

Drell-Yan (W, Z) production of lepton pairs

- best known cross section at LHC, at NNLO : scale uncert. ~ 1% !

- Similarly for W⁺/W⁻ (ratios are good!!)
- NNLO scale uncertainty 0.5 - 0.7 %
- **Constrain PDFs, determine Lumi.**

Top-Physics

- See the top immediately
- simple selection : Missing E_T, 1 lepton, ≥4 jets , **NO b-tag (!)**, cut on hadronic W mass

Atlas FullSim Preliminary

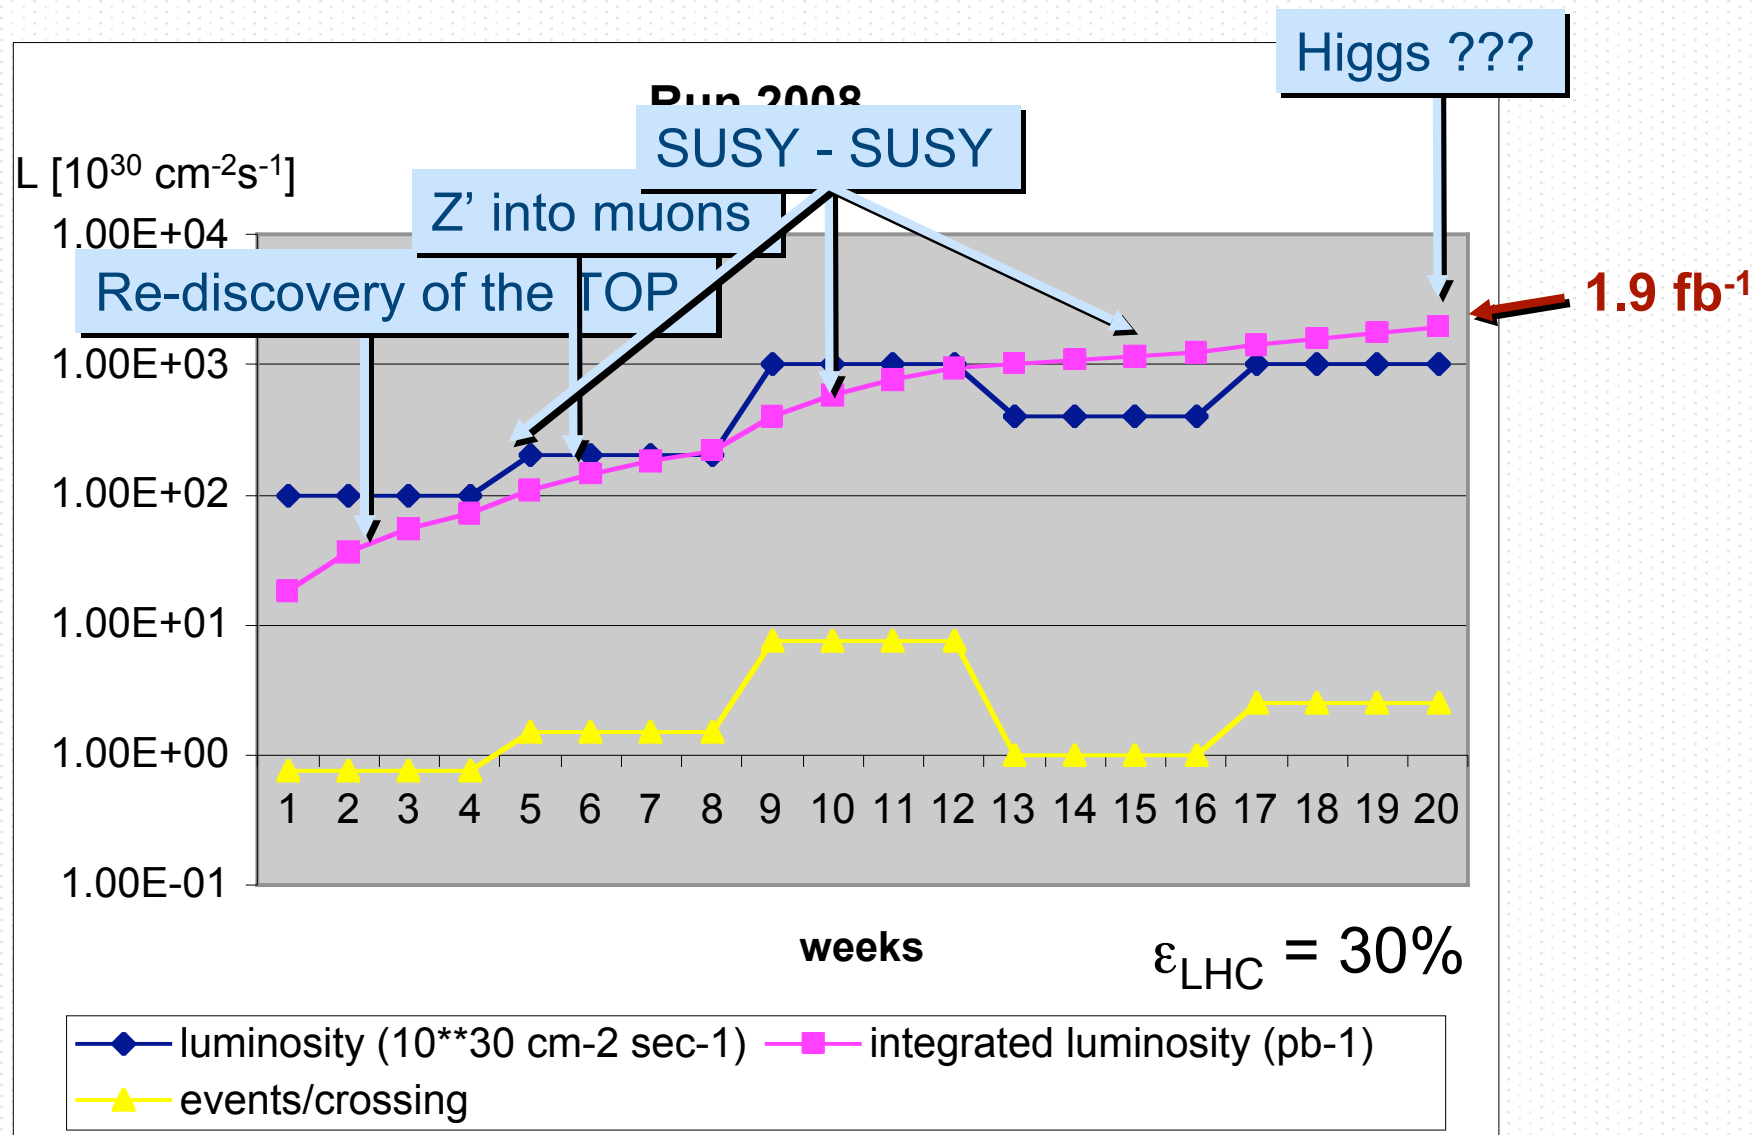

- Study the **top quark properties**
 - mass, charge, spin, couplings, production and decay, $\Delta M_{\text{top}} \sim 1 \text{ GeV}$?
- important background for searches
- **Jet energy scale** from W → jet jet, commission b-tagging

The path to discovery

Some comments

“Doing something ordinary is a waste of time” (Madonna)

Event rates

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

Event production rates at $L=10^{33} \text{ cm}^{-2} \text{ s}^{-1}$ and statistics to tape

Process	Events/s	Evts on tape, 10 fb^{-1}
$W \rightarrow e\nu$	15	10^8
$Z \rightarrow ee$	1	10^7
$t \bar{t}$	1	10^6
Minimum bias	10^8	10^7
QCD jets $p_T > 150 \text{ GeV}/c$	10^2	10^7
$b \bar{b} \rightarrow \mu X$	10^3	10^7
gluinos, $m=1 \text{ TeV}$	0.001	10^3
Higgs, $m=130 \text{ GeV}$	0.02	10^4

assuming 1%
of trigger
bandwidth

10^7 events to tape every 3 days, assuming 30% data taking efficiency, 1 PB/year/exp

- ⇒ statistical error negligible after few days (in most cases) !
- ⇒ **dominated by systematic errors** (detector understanding, luminosity, theory)

Our Master Equation

Introduction

Comments

Stat vs syst errors, backgrounds from data or MC? Signal Significance

$$\sigma_{\text{meas}} = \frac{N_{\text{obs}} - N_{\text{bkg}}}{\epsilon L}$$

Understand isolation, jet veto; p_T distributions at NLO; need calculations for detectable acceptance.

$$\sigma_{\text{theo}} = PDF(x_1, x_2, Q^2) \otimes \sigma_{\text{hard}}$$

constrain, define uncertainties

HO calculations, implement in MC

Early SUSY discovery?

- Introduction
- Status of
- Machine
- Detectors
- Startup of
- Machine
- Detectors.
- First Physics
- Comments**

- Large squark/gluino pair prod. cross sections, ~ 100 evts/day at 10^{33} for $m(\text{squarks, gluinos}) \sim 1$ TeV. Spectacular signatures

eg. $M_{\text{eff}} = E_T^{\text{miss}} + \sum_{\text{jets}} p_T(j)$

Use multi-jet, multi-leptons and E_t^{miss} for discrimination.

Beware ! : Good understanding of detector and SM bckgrds needed! eg. parton shower not enough!

Warnings...

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

- Always try to be as independent from the Monte Carlo as possible!
 - eg. find a “Standard Model candle” for calibration
 - Obtain **backgrounds from the data** whenever possible
 - Easy if we have mass peak (from sidebands)
 - More difficult in case of excess in high-energy tails, in particular in relation to MET or high- E_T jets

 - But what to do ?
 - Some examples in the following
 - Study carefully the validity of a Monte Carlo, and what it is exactly based on
 - eg. LO 2-to-2 process + parton shower, or 2-to-n + parton shower, or NLO+parton shower, or ...

- Worry in particular about systematic errors in your search analysis when **$S/B \ll 1$!!**
 - be careful with calculation of significance

Getting things from data

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

■ Calibrations

■ Electromagnetic calorimetry

- $Z \rightarrow ee$, $W \rightarrow e\nu$, Minimum-bias

■ Hadronic calorimetry and jets

- Di-jet balance, $Z (\rightarrow ll) + 1j$, $W \rightarrow jj$ in tt events, photon + jet

■ MET

- $Z (\rightarrow ll) + jets$, then remove leptonic information

■ Tracker and Muon alignment :

- $Z \rightarrow \mu\mu$, $W \rightarrow \mu\nu$

■ Lepton efficiencies, b-tagging

- $Z \rightarrow ee$, $Z \rightarrow \mu\mu$
- b-tag : use $t\bar{t}$ events to commission

■ Important kinematic properties

- $W + n$ jets, p_t of W : take $Z (\rightarrow ll) + n$ jets
- Use $bbZ (\rightarrow ll)$ as benchmark for bbA

■ Backgrounds

- Sidebands, or
- normalize background via background-enhancing selection, use theory to extrapolate to signal-enhancing selection

Background extrapolation

Introduction

Status of

Backgrounds to H WW $e|e|$: $t\bar{t}$ for gluon fusion, $t\bar{t}j$ for qqH

Idea of extrapolation:

Cavelli, Kauer, Zeppenfeld

$$\sigma_{bkg} \approx \underbrace{\left(\frac{\sigma_{bkg, LO}}{\sigma_{ref, LO}} \right)}_{\text{low theoret. uncertainty}} \cdot \underbrace{\sigma_{ref}}_{\text{low experim. uncertainty}}$$

σ_{bkg} : background with cuts optimized for finding signal

σ_{ref} : background with cuts to enrich background (eg. revert the cuts above)

— ~ 5% background uncertainty

Further Remarks

Introduction

Status of

Machine

Detectors

Startup of

Machine

Detectors.

First Physics

Comments

- What are the important calculations needed, where is phenom. work wanted? Signal and Bkg:
 - NLO wherever possible
 - MC@NLO wherever possible!
 - NNLO, fully differential
 - at least for the basic processes
 - Backgrounds are important now, especially :
 - tt, ttj ,ttjj, W/Z+jets
 - Investigate ratio method for more processes

- Other interesting processes
 - Jet + photon/Z : gluon pdf
 - Excellent understanding of incl. jet and di-jet prod.

Summary

- We ARE getting ready for the LHC
- CERN is fully committed to the LHC project
 - Everybody (machine and detectors) is working like crazy to be in time
- Many efforts now concentrating on the very details of the start-up procedure
 - How to analyze the first data coming out
- Physics studies
 - be careful when using Monte Carlo programs for background (and signal) evaluation
 - The ingenuity of the experimenters really becomes visible when working on methods to get as much as possible from the data

“If we don’t succeed, we run the risk of failure” (B. Clinton)
