

# Central Limit Theorem for discrete log-gases

**Vadim Gorin**

MIT (Cambridge) and IITP (Moscow)

(based on joint work with Alexei Borodin and Alice Guionnet)

June, 2015

## Setup and overview

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_N, \quad \ell_i = \lambda_i + \theta i$$

Probability distributions on *discrete*  $N$ -tuples of the form.

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

Discrete log-gas.

We go **beyond** specific integrable weights.

## Setup and overview

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_N, \quad \ell_i = \lambda_i + \theta i$$

Probability distributions on *discrete*  $N$ -tuples of the form.

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

Discrete log-gas.

We go **beyond** specific integrable weights.

- Appearance in probabilistic models of statistical mechanics.
- Law of Large Numbers and Central Limit Theorem for global fluctuations as  $N \rightarrow \infty$  under mild assumptions on  $w(x; N)$ .
- Our main tool: **discrete loop equations**.

## Appearance of discrete log-gases

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

At  $\theta = 1$  becomes...

## Appearance of discrete log-gases

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

At  $\theta = 1$  becomes...

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (\ell_j - \ell_i)^2 \prod_{i=1}^N w(\ell_i; N),$$

which frequently appears in natural stochastic systems.

E.g.

## Krawtchouk ensemble

- $N$  independent simple random walks
- probability of jump  $p$
- started at *adjacent* lattice points
- conditioned **never to collide**

## Krawtchouk ensemble

- $N$  independent simple random walks
- probability of jump  $p$
- started at *adjacent* lattice points
- conditioned **never to collide**

**Claim.** (Konig–O’Connell–Roch) Distribution of  $N$  walkers at time  $t$

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (\ell_j - \ell_i)^2 \prod_{i=1}^N \left[ p^{\ell_i} (1-p)^{M-\ell_i} \binom{M}{\ell_i} \right], \quad M = N + t - 1.$$

## Krawtchouk ensemble

**Claim.** (Konig–O’Connell–Roch) Distribution of  $N$  walkers at time  $t$

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (\ell_j - \ell_i)^2 \prod_{i=1}^N \left[ p^{\ell_i} (1-p)^{M-\ell_i} \binom{M}{\ell_i} \right], \quad M = N + t - 1.$$

**Claim.** (Johansson) In random domino tilings of Aztec diamond.

## Krawtchouk ensemble

**Claim.** (Konig–O’Connell–Roch) Distribution of  $N$  walkers at time  $t$

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (\ell_j - \ell_i)^2 \prod_{i=1}^N \left[ p^{\ell_i} (1-p)^{M-\ell_i} \binom{M}{\ell_i} \right], \quad M = N + t - 1.$$

**Claim.** (Johansson) In random domino tilings of Aztec diamond.

# Hahn ensemble

- Regular  $A \times B \times C$  hexagon
- 3 types of **lozenges**

## Hahn ensemble

- Regular  $A \times B \times C$  hexagon
- 3 types of **lozenges**

- **uniformly random** tiling

## Hahn ensemble

- Regular  $A \times B \times C$  hexagon
- **uniformly random** tiling
- Distribution of  $N$  horizontal lozenges on  $t$ -th vertical?

## Hahn ensemble

- Regular  $A \times B \times C$  hexagon
- **uniformly random** tiling
- Distribution of  $N$  horizontal lozenges on  $t$ -th vertical?

$$N = B + C - t$$

$$t > \max(B, C)$$

$$(a)_n = a(a+1)\dots(a+n-1)$$

**Claim.** (Cohn–Larsen–Propp)

$$\frac{1}{Z} \prod_{i < j} (l_i - l_j)^2 \prod_{i=1}^N \left[ (A + B + C + 1 - t - l_i)_{t-B} (l_i)_{t-C} \right]$$

## Two-interval support

- Regular  $A \times B \times C$  hexagon
- Rhombic hole of size  $D$  at vertical position  $H$ .

## Two-interval support

- Regular  $A \times B \times C$  hexagon
- Rhombic hole of size  $D$  at vertical position  $H$ .
- **uniformly random** tiling

## Two-interval support

- Regular  $A \times B \times C$  hexagon
- Rhombic hole of size  $D$  at vertical position  $H$ .
- **uniformly random** tiling
- Distribution of  $N$  horizontal lozenges on the vertical going through the axis of the hole?

## Two-interval support

- Regular  $A \times B \times C$  hexagon
- Rhombic hole of size  $D$  at vertical position  $H$ .
- **uniformly random** tiling
- Distribution of  $N$  horizontal lozenges on the vertical going through the axis of the hole?

**Claim.** It is:  
(and similarly for  $k$  holes)

$$\prod_{i < j} (l_i - l_j)^2 \prod_{i=1}^N \left[ (A+B+C+1-t-l_i)_{t-B} (l_i)_{t-C} (H-l_i)_D (H-l_i)_D \right]$$

## General $\theta$ case

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

- $\ell_i = L \cdot x_i, \quad L \rightarrow \infty, \quad \beta = 2\theta.$

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (x_j - x_i)^\beta \prod_{i=1}^N w(x_i; N).$$

Eigenvalue ensembles of **random matrix theory**.

$\beta = 1, 2, 4$  corresponds to real/complex/quaternion matrices.

## General $\theta$ case

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

- $\ell_i = L \cdot x_i, \quad L \rightarrow \infty, \quad \beta = 2\theta.$

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (x_j - x_i)^\beta \prod_{i=1}^N w(\ell_i; N).$$

Eigenvalue ensembles of **random matrix theory**.

$\beta = 1, 2, 4$  corresponds to real/complex/quaternion matrices.

- Another appearance — **asymptotic representation theory**

(Olshanski:  $(z, w)$ -measures).

Factor  $\frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)}$  links to evaluation formulas for

**Jack** symmetric polynomials.

## Large $N$ setup

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

$k$  regions with prescribed **filling fractions**

1.  $w(\cdot; N)$  vanishes at the boundaries of the regions.
2. All data **regularly** depends on  $N \rightarrow \infty$

## Large $N$ setup

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

$k$  regions with prescribed **filling fractions**

1.  $w(\cdot; N)$  vanishes at the boundaries of the regions.
2. All data **regularly** depends on  $N \rightarrow \infty$

$$a_i = \alpha_i N + \dots, \quad b_i = \beta_i N + \dots, \quad n_i = \hat{n}_i N + \dots$$

$$w(x; N) = \exp\left(NV_N\left(\frac{x}{N}\right)\right), \quad NV_N(z) = NV(z) + \dots$$

**Potential**  $V(z)$  should have bounded derivative (except at end-points, where we allow  $V(z) \approx c \cdot z \ln(z)$ ).

## Law of Large Numbers

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

**Theorem.** Suppose that all data **regularly** depends on  $N \rightarrow \infty$ , then the LLN holds: There exists  $\mu(x)dx$  with  $0 \leq \mu(x) \leq \theta^{-1}$ , such that for any Lipschitz  $f$  and any  $\varepsilon > 0$

$$\lim_{N \rightarrow \infty} N^{1/2-\varepsilon} \left| \frac{1}{N} \sum_{i=1}^N f\left(\frac{\ell_i}{N}\right) - \int f(x) \mu(x) dx \right| = 0$$

In fact the difference is  $O(1/N)$ .

## Law of Large Numbers

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

**Theorem.** Suppose that all data **regularly** depends on  $N \rightarrow \infty$ , then the LLN holds: There exists  $\mu(x)dx$  with  $0 \leq \mu(x) \leq \theta^{-1}$ , such that for any Lipschitz  $f$  and any  $\varepsilon > 0$

$$\lim_{N \rightarrow \infty} N^{1/2-\varepsilon} \left| \frac{1}{N} \sum_{i=1}^N f\left(\frac{\ell_i}{N}\right) - \int f(x) \mu(x) dx \right| = 0$$

$\mu(x)dx$  is the **unique maximizer** of the functional  $I_V$

$$I_V[\rho] = \theta \iint_{x \neq y} \ln|x-y| \rho(dx) \rho(dy) - \int_{-\infty}^{\infty} V(x) \rho(dx).$$

in appropriate class of measures taking into account filling fractions

## Law of Large Numbers

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(l_j - l_i + 1) \Gamma(l_j - l_i + \theta)}{\Gamma(l_j - l_i) \Gamma(l_j - l_i + 1 - \theta)} \prod_{i=1}^N w(l_i; N),$$

**Theorem.** Suppose that all data **regularly** depends on  $N \rightarrow \infty$ , then the LLN holds: There exists  $\mu(x)dx$  with  $0 \leq \mu(x) \leq \theta^{-1}$ , such that for any Lipschitz  $f$  and any  $\varepsilon > 0$

$$\lim_{N \rightarrow \infty} N^{1/2-\varepsilon} \left| \frac{1}{N} \sum_{i=1}^N f\left(\frac{l_i}{N}\right) - \int f(x) \mu(x) dx \right| = 0$$

$\mu(x)dx$  is the **unique maximizer** of the functional  $I_V$

$$I_V[\rho] = \theta \iint_{x \neq y} \ln|x - y| \rho(dx) \rho(dy) - \int_{-\infty}^{\infty} V(x) \rho(dx).$$

This is a **very general** statement. Lots of analogues.

# Law of Large Numbers: example

(Pictures by L. Petrov)

## Law of Large Numbers: example

Graph of  $\lambda_i = \ell_i - i$  (green lozenges) along the middle vertical

## Law of Large Numbers: example

(Pictures by L. Petrov)

## Law of Large Numbers: example

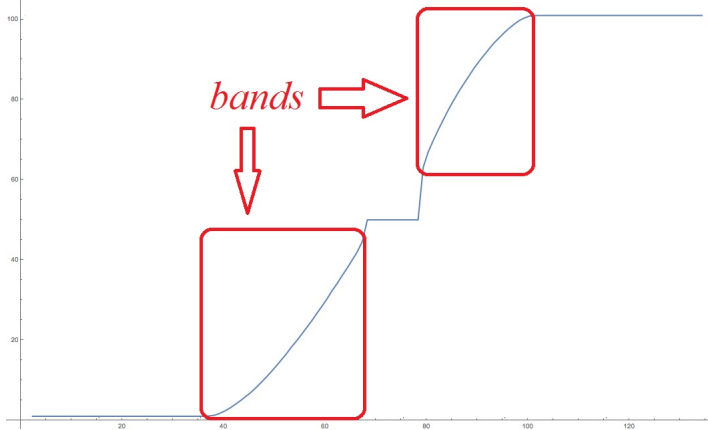

Graph of  $\lambda_i = \ell_i - i$  (green lozenges) along the vertical axis of hole

The filling fractions above and below the hole are **fixed**.

## Law of Large Numbers: example

Averaged  $\lambda_i = \ell_i - i$  (green lozenges) along the vertical axis of hole

- Frozen region: void. No particles,  $\mu(x) = 0$ .
- Frozen region: saturation. Dense packing,  $\mu(x) = \theta^{-1}$ .
- **Band.**

## Central Limit Theorem?

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

Is there a next order, as in CLT?

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f\left(\frac{\ell_i}{N}\right) - \mathbb{E}f\left(\frac{\ell_i}{N}\right) \right] \quad ?$$

## Central Limit Theorem?

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} (x_j - x_i)^\beta \prod_{i=1}^N \exp(-NV(x_i))$$

Is there a next order, as in CLT?

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f\left(\frac{\ell_i}{N}\right) - \mathbb{E}f\left(\frac{\ell_i}{N}\right) \right] \quad ?$$

- In continuous setting of RMT theory — yes, **CLT**.  
(Johansson–1998) one cut/one band, quite general  $V(x)$ .  
...  
(Borot–Guionnet–2013) generic analytic  $V(x)$ , fixed filling fractions in each band. If not fixed  $\Rightarrow$  discrete component.

## Central Limit Theorem?

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

Is there a next order, as in CLT?

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f\left(\frac{\ell_i}{N}\right) - \mathbb{E}f\left(\frac{\ell_i}{N}\right) \right] \quad ?$$

- In continuous setting of RMT theory — yes, **CLT**.
- Discreteness of the model might show up somewhere. E.g. local limits **must** be different. Also there is rounding in  $1/N$  expansion of  $\mathbb{E} \sum f(\ell_i/N)$ . Can CLT feel being discrete?

## Central Limit Theorem?

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f\left(\frac{\ell_i}{N}\right) - \mathbb{E}f\left(\frac{\ell_i}{N}\right) \right] \quad ?$$

- In continuous setting of RMT theory — yes, **CLT**.
- Discreteness of the model might show up somewhere. E.g. local limits **must** be different. Also there is rounding in  $1/N$  expansion of  $\mathbb{E} \sum f(\ell_i/N)$ . Can CLT feel being discrete?
- (Kenyon–2006), (Petrov–2012) CLT (GFF) for tilings of some simply-connected domains. What if there are holes?

## Central Limit Theorem?

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$
$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f\left(\frac{\ell_i}{N}\right) - \mathbb{E} f\left(\frac{\ell_i}{N}\right) \right] \quad ?$$

- In continuous setting of RMT theory — yes, **CLT**.
- Discreteness of the model might show up somewhere. E.g. local limits **must** be different. Also there is rounding in  $1/N$  expansion of  $\mathbb{E} \sum f(\ell_i/N)$ . Can CLT feel being discrete?
- (Kenyon–2006), (Petrov–2012) CLT (GFF) for tilings of some simply-connected domains. What if there are holes?
- Several other discrete CLT's exploit specific **integrability**. Methods not suitable for generic models. Approach of Johansson seems to miss a critical ingredient in discrete world.

## Central Limit Theorem

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

$k$  regions with prescribed **filling fractions**

**Theorem.** Assume that  $w(\cdot; N)$  and  $V(\cdot)$  are analytic ( $x \ln(x)$  behavior of  $V$  at end-points is ok), all data depends on  $N$  regularly, and  $\mu(x)dx$  is such that there is **one** band in each region. Then under *technical assumptions*, for analytic  $f_1(x), \dots, f_m(x)$

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f_j \left( \frac{\ell_i}{N} \right) - \mathbb{E} f_j \left( \frac{\ell_i}{N} \right) \right], \quad j = 1, \dots, m.$$

are jointly **Gaussian** with explicit covariance.

## Central Limit Theorem

**Theorem.** Assume that all data depends on  $N$  regularly,  $V(x)$  is analytic (expect for possible  $x \ln(x)$  behavior at end-points), and  $\mu(x)dx$  is such that there is **one** band in each region. Then under *technical assumptions*, for analytic  $f_1(x), \dots, f_m(x)$

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f_j \left( \frac{\ell_i}{N} \right) - \mathbb{E} f_j \left( \frac{\ell_i}{N} \right) \right], \quad j = 1, \dots, m.$$

are jointly **Gaussian** with explicit covariance.

- In all the examples shown so far the technical assumption is easy to check. Always holds for convex  $V(x)$  with one band.

## Central Limit Theorem

**Theorem.** Assume that all data depends on  $N$  regularly,  $V(x)$  is analytic (expect for possible  $x \ln(x)$  behavior at end-points), and  $\mu(x)dx$  is such that there is **one** band in each region. Then under *technical assumptions*, for analytic  $f_1(x), \dots, f_m(x)$

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f_j \left( \frac{\ell_i}{N} \right) - \mathbb{E} f_j \left( \frac{\ell_i}{N} \right) \right], \quad j = 1, \dots, m.$$

are jointly **Gaussian** with explicit covariance.

- In all the examples shown so far the technical assumption is easy to check. Always holds for convex  $V(x)$  with one band.
- **Conjecture (work in progress).** Technical assumption holds in *generic* case (e.g. a.s. in  $\theta$ ).

## Central Limit Theorem

**Theorem.** Assume that all data depends on  $N$  regularly,  $V(x)$  is analytic (expect for possible  $x \ln(x)$  behavior at end-points), and  $\mu(x)dx$  is such that there is **one** band in each region. Then under *technical assumptions*, for analytic  $f_1(x), \dots, f_m(x)$

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f_j \left( \frac{\ell_i}{N} \right) - \mathbb{E} f_j \left( \frac{\ell_i}{N} \right) \right], \quad j = 1, \dots, m.$$

are jointly **Gaussian** with explicit covariance.

- In all the examples shown so far the technical assumption is easy to check. Always holds for convex  $V(x)$  with one band.
- **Conjecture (work in progress)**. Technical assumption holds in *generic* case (e.g. a.s. in  $\theta$ ).
- The covariance depends only on **end-points** of the bands. A log-correlated (generalized) Gaussian field. Section of 2d GFF.
- The result coincides with **universal** behavior in random matrices / continuous  $\beta$  log-gases. (Johansson), (Bonnet-David-Eynard; Scherbina; Borot-Guionnet).

## Central Limit Theorem

**Theorem.** Assume that all data depends on  $N$  regularly,  $V(x)$  is analytic (expect for possible  $x \ln(x)$  behavior at end-points), and  $\mu(x)dx$  is such that there is **one** band in each region. Then under *technical assumptions*, for analytic  $f_1(x), \dots, f_m(x)$

$$\lim_{N \rightarrow \infty} \sum_{i=1}^N \left[ f_j \left( \frac{\ell_i}{N} \right) - \mathbb{E} f_j \left( \frac{\ell_i}{N} \right) \right], \quad j = 1, \dots, m.$$

are jointly **Gaussian** with explicit covariance.

- For a number of **particular** models the result was established before.
- However this is the first **generic** result.  
(For  $\theta = 1$  case cf. the talk of Maurice Duits tomorrow)

## Central Limit Theorem: example

Graph of  $\ell_i - \mathbb{E}\ell_i$  (green lozenges) along the vertical axis of hole

The rough fluctuations are  
*smoothed* in CLT

- The filling fractions above and below the hole are **fixed**.
- Comparison with RMT predicts that if we do not fix them, then a **discrete** component would appear.

## Central Limit Theorem: example

Graph of  $l_i - \mathbb{E}l_i$  (green lozenges) along the vertical axis of hole

The rough fluctuations are  
*smoothed* in CLT

- Comparison with RMT predicts that if we do not fix them, then a **discrete** component would appear. **Why?**

## Central Limit Theorem: example

The rough fluctuations are  
*smoothed* in CLT

- Comparison with RMT predicts that if we do not fix them, then a **discrete** component would appear. **Why?**
- Jump of one particle through the hole leads to a macroscopic fluctuation of  $\sum_{i=1}^N [f(\ell_i/N) - \mathbb{E}f(\ell_i/N)]$

## Form of measure

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

What's so special about this measure? Why not  $\prod_{i < j} (\ell_j - \ell_i)^\beta$ ?

## Form of measure

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

What's so special about this measure? Why not  $\prod_{i < j} (\ell_j - \ell_i)^\beta$ ?

Recall: Johansson's CLT in RMT is based on **loop equation**

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} |x_j - x_i|^\beta \prod_{i=1}^N \exp(-NV(x_i)).$$

$$G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - x_i}.$$

$$[\mathbb{E} G_N(z)]^2 + \frac{2}{\beta} V'(z) [\mathbb{E} G_N(z)] + (\text{analytic}) = \frac{1}{N} (\dots)$$

Obtained by clever **integration by parts**.

## Form of measure

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

What's so special about this measure? Why not  $\prod_{i < j} (\ell_j - \ell_i)^\beta$ ?

*Recall:* Johansson's CLT in RMT is based on **loop equation**

$$G_N(z)^2 + \frac{2}{\beta} V'(z) G_N(z) + (\text{analytic}) = \frac{1}{N} (\dots)$$

It also has applications far beyond. E.g. recently in edge universality in RMT (Bourgade–Erdos–Yau), (Bekerman–Figalli–Guionnet)

Discrete CLT was long **blocked** by absence of a discrete analogue.

## Form of measure

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

What's so special about this measure? Why not  $\prod_{i < j} (\ell_j - \ell_i)^\beta$ ?

Recall: Johansson's CLT in RMT is based on **loop equation**

$$G_N(z)^2 + \frac{2}{\beta} V'(z) G_N(z) + (\text{analytic}) = \frac{1}{N} (\dots)$$

Form of discrete measure, for which an analogue could exist?

Can be hinted by **discrete Selberg integrals**.

$$\int_{\mathbb{R}^N} \prod_{1 \leq i < j \leq N} |x_j - x_i|^\beta \prod_{i=1}^N w(x), \quad w(x) = \begin{cases} x^a (1-x)^b \mathbf{1}_{0 < x < 1}, \\ x^a e^{-x} \mathbf{1}_{x > 0}, \\ e^{-x^2}. \end{cases}$$

Known **explicit** formula manifests integrability of  $\beta$  log-gases.

## Form of measure

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

What's so special about this measure? Why not  $\prod_{i < j} (\ell_j - \ell_i)^\beta$ ?

Recall: Johansson's CLT in RMT is based on **loop equation**

$$G_N(z)^2 + \frac{2}{\beta} V'(z) G_N(z) + (\text{analytic}) = \frac{1}{N} (\dots)$$

Form of discrete measure, for which an analogue could exist?

Can be hinted by **discrete Selberg integrals**.

$$\sum_{\mathbb{Z}^N} \prod_{1 \leq i < j \leq N} |x_j - x_i|^\beta \prod_{i=1}^N w(x), \quad w(x) = \begin{cases} p^x (1-p)^{M-x} \binom{M}{x} \mathbf{1}_{0 \leq x \leq M}, \\ (x)_M q^x \mathbf{1}_{x \geq 0}, \\ c^x / x! \mathbf{1}_{x \geq 0}. \end{cases}$$

Is known **only** at  $\beta = 2$ , but...

## Form of measure

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

What's so special about this measure? Why not  $\prod_{i < j} (\ell_j - \ell_i)^\beta$ ?

Recall: Johansson's CLT in RMT is based on **loop equation**

$$G_N(z)^2 + \frac{2}{\beta} V'(z) G_N(z) + (\text{analytic}) = \frac{1}{N} (\dots)$$

Form of discrete measure, for which an analogue could exist?

Can be hinted by **discrete Selberg integrals**.

$$\ell_i = \lambda_i + (i-1)\theta, \quad 0 \leq \lambda_1 \leq \lambda_2 \leq \dots \leq \lambda_N - \text{integers}$$

$$\sum \prod_{i < j} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N \frac{c^x}{\Gamma(\ell_i + 1)}.$$

is explicit **for all  $\theta > 0$**  via Jack polynomials (+2 "binomial"  $w(x)$ ). 

## Main tool: Nekrasov equation

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(l_j - l_i + 1) \Gamma(l_j - l_i + \theta)}{\Gamma(l_j - l_i) \Gamma(l_j - l_i + 1 - \theta)} \prod_{i=1}^N w(l_i; N),$$

**Theorem.** Assume

$$\frac{w(x; N)}{w(x-1; N)} = \frac{\phi_N^+(x)}{\phi_N^-(x)}, \quad \text{for analytic } \phi_N^\pm.$$

Then

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - l_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - l_i - 1} \right) \right].$$

is **analytic** in the  $\mathcal{D} \subset \mathbb{C}$ , where  $\phi_N^\pm$  are.

## Main tool: Nekrasov equation

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(l_j - l_i + 1) \Gamma(l_j - l_i + \theta)}{\Gamma(l_j - l_i) \Gamma(l_j - l_i + 1 - \theta)} \prod_{i=1}^N w(l_i; N),$$

**Theorem.** Assume

$$\frac{w(x; N)}{w(x-1; N)} = \frac{\phi_N^+(x)}{\phi_N^-(x)}, \quad \text{for analytic } \phi_N^\pm.$$

Then

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - l_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - l_i - 1} \right) \right].$$

is **analytic** in the  $\mathcal{D} \subset \mathbb{C}$ , where  $\phi_N^\pm$  are.

- This is a modification of (Nekrasov–Pestun), (Nekrasov–Shatashvili), (Nekrasov)

## Main tool: Nekrasov equation

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

**Theorem.** Assume

$$\frac{w(x; N)}{w(x-1; N)} = \frac{\phi_N^+(x)}{\phi_N^-(x)}, \quad \text{for analytic } \phi_N^\pm.$$

Then

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - \ell_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - \ell_i - 1} \right) \right].$$

is **analytic** in the  $\mathcal{D} \subset \mathbb{C}$ , where  $\phi_N^\pm$  are.

- This is a modification of (Nekrasov–Pestun), (Nekrasov–Shatashvili), (Nekrasov)
- Knowing the statement, the proof is elementary.

## Main tool: Nekrasov equation

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

is **analytic** in the  $\mathcal{D} \subset \mathbb{C}$ , where  $\phi_N^\pm$  are.

- This is a modification of (Nekrasov–Pestun), (Nekrasov–Shatashvili), (Nekrasov)
- Knowing the statement, the proof is elementary.
- Discrete analogue of loop / Schwinger–Dyson equations.

## Main tool: Nekrasov equation

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(l_j - l_i + 1) \Gamma(l_j - l_i + \theta)}{\Gamma(l_j - l_i) \Gamma(l_j - l_i + 1 - \theta)} \prod_{i=1}^N w(l_i; N),$$

**Theorem.** Assume

$$\frac{w(x; N)}{w(x-1; N)} = \frac{\phi_N^+(x)}{\phi_N^-(x)}, \quad \text{for analytic } \phi_N^\pm.$$

Then

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - l_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - l_i - 1} \right) \right].$$

is **analytic** in  $\mathcal{D} \subset \mathbb{C}$ , where  $\phi_N^\pm$  are.

How to use this theorem for asymptotic study?

- $\phi^\pm$  — small degree polynomials (linear?), then the result is also a polynomial. Find it to get equations.
- As degree grows, not very helpful. Need another approach.

## Functions $R_\mu$ and $Q_\mu$

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(l_j - l_i + 1) \Gamma(l_j - l_i + \theta)}{\Gamma(l_j - l_i) \Gamma(l_j - l_i + 1 - \theta)} \prod_{i=1}^N w(l_i; N),$$

$$\frac{w(x; N)}{w(x-1; N)} = \frac{\phi_N^+(x)}{\phi_N^-(x)}, \quad \text{for analytic } \phi_N^\pm.$$

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - l_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - l_i - 1} \right) \right].$$

**Regularity** of data as  $N \rightarrow \infty$  includes and implies

$$\phi_N^\pm(Nz) = \phi^\pm(z) + \dots, \quad \frac{\phi^+(z)}{\phi^-(z)} = \exp \left( -\frac{\partial}{\partial z} V(z) \right)$$

## Functions $R_\mu$ and $Q_\mu$

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - \ell_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - \ell_i - 1} \right) \right].$$

**Regularity** of data as  $N \rightarrow \infty$  includes and implies

$$\phi_N^\pm(Nz) = \phi^\pm(z) + \dots, \quad \frac{\phi^+(z)}{\phi^-(z)} = \exp \left( -\frac{\partial}{\partial z} V(z) \right)$$

Then  $\xi = Nz$ ,  $N \rightarrow \infty$  leads to analyticity of

$$R_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) + \phi^+(z) \exp(\theta G_\mu(z))$$

$G_\mu$  is the **Stieltjes transform** of limiting density.

$$G_\mu(z) = \int \frac{1}{z - x} \mu(x) dx.$$

## Functions $R_\mu$ and $Q_\mu$

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - \ell_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - \ell_i - 1} \right) \right].$$

Then  $\xi = Nz$ ,  $N \rightarrow \infty$  leads to analyticity of

$$R_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) + \phi^+(z) \exp(\theta G_\mu(z))$$

We also need

$$Q_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) - \phi^+(z) \exp(\theta G_\mu(z))$$

$G_\mu$  is the **Stieltjes transform** of limiting density.

$$G_\mu(z) = \int \frac{1}{z - x} \mu(x) dx.$$

## Functions $R_\mu$ and $Q_\mu$

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx.$$

$$R_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) + \phi^+(z) \exp(\theta G_\mu(z))$$

$$Q_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) - \phi^+(z) \exp(\theta G_\mu(z))$$

**Key technical assumption:** for analytic  $H(z)$

$$Q_\mu(z) = H(z) \prod_{i=1}^k \sqrt{(z-u_i)(z-v_i)}, \quad H(z) \neq 0.$$

- Quadratic singularities:  $Q_\mu(z) = \sqrt{R_\mu(z)^2 - 4\phi^+(z)\phi^-(z)}$ .

## Functions $R_\mu$ and $Q_\mu$

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx.$$

$$R_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) + \phi^+(z) \exp(\theta G_\mu(z))$$

$$Q_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) - \phi^+(z) \exp(\theta G_\mu(z))$$

**Key technical assumption:** for analytic  $H(z)$

$$Q_\mu(z) = H(z) \prod_{i=1}^k \sqrt{(z-u_i)(z-v_i)}, \quad H(z) \neq 0.$$

- Quadratic singularities:  $Q_\mu(z) = \sqrt{R_\mu(z)^2 - 4\phi^+(z)\phi^-(z)}$ .
- $u_i$  and  $v_i$  must be end-points of bands.

## Second order expansion

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - \ell_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - \ell_i - 1} \right) \right].$$

$$R_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) + \phi^+(z) \exp(\theta G_\mu(z))$$

$$Q_\mu(z) = \phi^-(z) \exp(-\theta G_\mu(z)) - \phi^+(z) \exp(\theta G_\mu(z))$$

**Second order** expansion as  $N \rightarrow \infty$  gives

$$Q_\mu(z) \cdot N \mathbb{E}(G_N(z) - G_\mu(z)) = (\text{explicit}) + (\text{analytic}) + (\text{small}).$$

$$\text{Here } G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

(small) requires non-trivial technical work

## Second order expansion

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

**Second order** expansion as  $N \rightarrow \infty$  gives

$$\begin{aligned} H(z) \prod_{i=1}^k \sqrt{(z - u_i)(z - v_i)} \cdot N \mathbb{E}(G_N(z) - G_\mu(z)) \\ = (\text{explicit}) + (\text{analytic}) + (\text{small}). \end{aligned}$$

## Second order expansion

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

**Second order** expansion as  $N \rightarrow \infty$  gives

$$\begin{aligned} H(z) \prod_{i=1}^k \sqrt{(z - u_i)(z - v_i)} \cdot N \mathbb{E}(G_N(z) - G_\mu(z)) \\ = (\text{explicit}) + (\text{analytic}) + (\text{small}). \end{aligned}$$

$$\begin{aligned} \frac{1}{z-y} \prod_{i=1}^k \sqrt{(z - u_i)(z - v_i)} \cdot N \mathbb{E}(G_N(z) - G_\mu(z)) \\ = (\text{explicit}) + (\text{analytic}) + (\text{small}). \end{aligned}$$

Integrate around  $\bigcup_{i=1}^k [u_i, v_i]$  to get  $\lim_{N \rightarrow \infty} N \mathbb{E}(G_N(y) - G_\mu(y))$ .

## Second order expansion

$$\frac{1}{z-y} \prod_{i=1}^k \sqrt{(z-u_i)(z-v_i)} \cdot N\mathbb{E}(G_N(z) - G_\mu(z))$$

= (explicit) + (analytic) + (small).

Integrate around  $\bigcup_{i=1}^k [u_i, v_i]$  to get  $\lim_{N \rightarrow \infty} N\mathbb{E}(G_N(y) - G_\mu(y))$ .

- We use **one band per interval**, as otherwise we can not integrate due to singularities of  $G_N$ .
- We use **fixed filling fractions**, to resolve the contribution of the residue at  $\infty$ .
- We use  $H(z) \neq 0$ , as otherwise the unknown (analytic) would contribute.

## Proof of Central Limit Theorem

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

We explicitly found  $\lim_{N \rightarrow \infty} N\mathbb{E}(G_N(y) - G_\mu(y))$ .

## Proof of Central Limit Theorem

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

We explicitly found  $\lim_{N \rightarrow \infty} N\mathbb{E}(G_N(y) - G_\mu(y))$ .

**Proposition.** Deform the weight by  $m$  factors

$$w(x; N) \rightarrow w(x; N) \prod_{a=1}^m \left( 1 + \frac{t_a}{y_a - x/N} \right).$$

Then  $\lim_{N \rightarrow \infty}$  of the mixed  $t_a$  derivative at 0 of  $N\mathbb{E}(G_N(y) - G_\mu(y))$  gives **joint cumulants** of

$$N\mathbb{E}(G_N(y) - G_\mu(y)), \quad N\mathbb{E}(G_N(y_a) - G_\mu(y_a)), \quad a = 1, \dots, m.$$

## Proof of Central Limit Theorem

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

We explicitly found  $\lim_{N \rightarrow \infty} N \mathbb{E}(G_N(y) - G_\mu(y))$ .

**Proposition.** Deform the weight by  $m$  factors

$$w(x; N) \rightarrow w(x; N) \prod_{a=1}^m \left( 1 + \frac{t_a}{y_a - x/N} \right).$$

Then  $\lim_{N \rightarrow \infty}$  of the mixed  $t_a$  derivative at 0 of  $N \mathbb{E}(G_N(y) - G_\mu(y))$  gives **joint cumulants** of

$$N \mathbb{E}(G_N(y) - G_\mu(y)), \quad N \mathbb{E}(G_N(y_a) - G_\mu(y_a)), \quad a = 1, \dots, m.$$

The deformed measure is in the same class. *If we justify* interchange of derivation and  $N \rightarrow \infty$  limit, then the cumulants yield **asymptotic Gaussianity** and the expression for covariance.

## Proof of Central Limit Theorem

$$G_\mu(z) = \int \frac{1}{z-x} \mu(x) dx, \quad G_N(z) = \frac{1}{N} \sum_{i=1}^N \frac{1}{z - \ell_i/N}.$$

**Proposition.** Deform the weight by  $m$  factors

$$w(x; N) \rightarrow w(x; N) \prod_{a=1}^m \left( 1 + \frac{t_a}{y_a - x/N} \right).$$

Then  $\lim_{N \rightarrow \infty}$  of mixed  $t_a$  derivative at 0 of  $N\mathbb{E}(G_N(y) - G_\mu(y))$  gives **joint cumulants** of  $N\mathbb{E}(G_N(y_a) - G_\mu(y_a))$

**Result:**  $\lim N\mathbb{E}(G_N(y) - \mathbb{E}G_N(y))$  — Gaussian. **One band**  $[u, v]$  :

$$\begin{aligned} & \lim_{N \rightarrow \infty} N^2 \mathbb{E} [G_N(y)G_N(z) - \mathbb{E}G_N(y)\mathbb{E}G_N(z)] \\ &= -\frac{1}{2(y-z)^2} \left( 1 - \frac{yz - \frac{1}{2}(u+v)(y+z) + u+v}{\sqrt{(y-u)(y-v)}\sqrt{(z-u)(z-v)}} \right), \end{aligned}$$

An explicit integral expression for  $k$  bands.

## Summary

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(l_j - l_i + 1) \Gamma(l_j - l_i + \theta)}{\Gamma(l_j - l_i) \Gamma(l_j - l_i + 1 - \theta)} \prod_{i=1}^N w(l_i; N),$$

- Central limit theorem with **universal** covariance under
  - One band per interval of support.
  - Technical assumption, which holds in many cases, e.g.

$(z, w)$ -measures of asymptotic representation theory  
 $w(x; N) = \exp(NV(x/N))$  with convex  $V$

**Conjecture (work in progress).** In *generic* situation. ⏪ ⏩ ⏴ ⏵ 🔍

## Summary

$$\frac{1}{Z} \prod_{1 \leq i < j \leq N} \frac{\Gamma(\ell_j - \ell_i + 1) \Gamma(\ell_j - \ell_i + \theta)}{\Gamma(\ell_j - \ell_i) \Gamma(\ell_j - \ell_i + 1 - \theta)} \prod_{i=1}^N w(\ell_i; N),$$

1. Central limit theorem with **universal** covariance under
  - One band per interval of support.
  - Technical assumption, which holds in many cases.**Conjecture (work in progress).** In *generic* situation.
2. An important ingredient of the proof is Nekrasov equation (discrete loop / Schwinger–Dyson equation)

$$\frac{w(x; N)}{w(x-1; N)} = \frac{\phi_N^+(x)}{\phi_N^-(x)}, \quad \text{for analytic } \phi_N^\pm.$$

$$\phi_N^-(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 - \frac{\theta}{\xi - \ell_i} \right) \right] + \phi_N^+(\xi) \cdot \mathbb{E} \left[ \prod_{i=1}^N \left( 1 + \frac{\theta}{\xi - \ell_i - 1} \right) \right]$$

is **analytic** in  $\mathcal{D} \subset \mathbb{C}$ , where  $\phi_N^\pm$  are.
