DEFECT

비로 시로에 시로에 시험에 시험에

• They probe aspects of the theory that are not accessible to correlation functions of local operators, e.g. global structure of the gauge group.

• There are several physically relevant examples

- Wilson and 't Hooft lines
- Boundaries and interfaces
- 8 Rényi entropy
- Surface defects
- Interplay of various techniques
 - AdS/CFT correspondence
 - Supersymmetric localization
 - Integrability
 - Conformal bootstrap

비교 시민에 시민에 시민에 시민에

- They probe aspects of the theory that are not accessible to correlation functions of local operators, e.g. global structure of the gauge group.
- They preserve part of the original (super)symmetry, leading to constraints on physical observables.

CFT

• Set of conformal primary operators $\mathcal{O}_{\Delta,\ell}(\mathsf{x})$ plus descendants $\partial_{\mu_1} \dots \partial_{\mu_n} \mathcal{O}_{\Delta,\ell}$.

• Operator product expansion (OPE)

$$\mathcal{O}_i(x)\mathcal{O}_j(0) = \sum_{k \in \text{prim.}} c_{ijk} |x|^{\Delta_k - \Delta_i - \Delta_j} \left(\mathcal{O}_k(0) \underbrace{+ x^{\mu} \partial_{\mu} \mathcal{O}_k(0) + \dots}_{\text{all fixed}} \right)$$

• The set of data $\{\Delta_i, c_{ijk}\}$ fully specifies the CFT, up to extended probes.

CFT

Set of conformal primary operators O_{Δ,ℓ}(x) plus descendants ∂_{µ1}...∂_{µn}O_{Δ,ℓ}.

• Operator product expansion (OPE)

$$\mathcal{O}_{i}(x)\mathcal{O}_{j}(0) = \sum_{k \in \text{prim.}} c_{ijk} |x|^{\Delta_{k} - \Delta_{i} - \Delta_{j}} \left(\mathcal{O}_{k}(0) \underbrace{+ x^{\mu} \partial_{\mu} \mathcal{O}_{k}(0) + \dots}_{\text{all fixed}} \right)$$

- The set of data $\{\Delta_i, c_{ijk}\}$ fully specifies the CFT, up to extended probes.
- Two- and three-point functions

$$\langle \mathcal{O}_{\Delta}(x)\mathcal{O}_{\Delta}(0)
angle o \Delta \qquad \langle \mathcal{O}_i(x_1)\mathcal{O}_j(x_2)\mathcal{O}_k(x_3)
angle o c_{ijk}$$

<ロ> <四> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆</p>

CFT

Set of conformal primary operators O_{Δ,ℓ}(x) plus descendants ∂_{μ1}...∂_{μn}O_{Δ,ℓ}.

• Operator product expansion (OPE)

$$\mathcal{O}_{i}(x)\mathcal{O}_{j}(0) = \sum_{k \in \text{prim.}} c_{ijk} |x|^{\Delta_{k} - \Delta_{i} - \Delta_{j}} \left(\mathcal{O}_{k}(0) \underbrace{+ x^{\mu} \partial_{\mu} \mathcal{O}_{k}(0) + \dots}_{\text{all fixed}} \right)$$

- The set of data $\{\Delta_i, c_{ijk}\}$ fully specifies the CFT, up to extended probes.
- Two- and three-point functions

$$\langle \mathcal{O}_{\Delta}(x) \mathcal{O}_{\Delta}(0)
angle o \Delta \qquad \langle \mathcal{O}_i(x_1) \mathcal{O}_j(x_2) \mathcal{O}_k(x_3)

• The naive set of defect CFT data is $\{a_{\mathcal{O}}, b_{\mathcal{O}\hat{\mathcal{O}}}, \hat{\Delta}_{\hat{\mathcal{O}}}, \hat{c}_{\hat{\mathcal{O}}_1\hat{\mathcal{O}}_2\hat{\mathcal{O}}_3}\}$.

DCFT

• Defect crossing

• Defect crossing

- Subset of defect CFT data:
 - Physically (or geometrically) relevant
 - Universal (present in any defect CFT)

< □ > < □ > < 三 > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Defect crossing

- Subset of defect CFT data:
 - Physically (or geometrically) relevant
 Universal (present in any defect CFT)
- Stress-tensor one-point function

$$\langle T^{ab}
angle_W = -h rac{(q-1)\delta^{ab}}{|x_\perp|^d} \ \langle T^{ij}
angle_W = h rac{(p+1)\delta^{ij} - d n^i n^j}{|x_\perp|^d}$$

Displacement operator

• A defect breaks translation invariance

$$\partial_{\mu} T^{\mu i}(x_{\perp}, x_{\parallel}) = \delta^{q}(x_{\perp}) \mathbb{D}^{i}(x_{\parallel})$$

<ロ> <四> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆</p>

Displacement operator

• A defect breaks translation invariance

$$\partial_{\mu} T^{\mu i}(x_{\perp}, x_{\parallel}) = \delta^{q}(x_{\perp}) \mathbb{D}^{i}(x_{\parallel})$$

• It implements small modifications of the defect

$$\left\langle \delta \left\langle X \right\rangle_{W} = -\int d^{p}x_{\parallel} \, \delta x_{i}(x_{\parallel}) \left\langle \mathbb{D}^{i}(x_{\parallel})X \right\rangle_{W}$$

• Its two-point function is fixed by conformal symmetry

$$\langle \mathbb{D}^{i}(\mathbf{x}_{\parallel}) \mathbb{D}^{j}(\mathbf{0}) \rangle_{W} = C_{D} \frac{\delta^{ij}}{|\mathbf{x}_{\parallel}|^{2(p+1)}}$$

イロン イ団と イヨン イヨン

Normalization fixed by Ward identity, C_D is physical. Like $\langle T_{\mu\nu}T_{\rho\sigma}\rangle \sim c$.

Relation between C_D and h

For superconformal defects [LB, Lemos, 2019]

$$C_{D} = \frac{2^{p+1}(q+p-1)(p+2)}{q-1} \frac{\Gamma(\frac{p+1}{2})}{\pi^{\frac{p+1}{2}}} \frac{\pi^{\frac{q}{2}}}{\Gamma(\frac{q}{2})} h.$$

◆□▶ ◆□▶ ◆目▶ ◆目▶ ◆□▶ ◆□

Relation between C_D and h

For superconformal defects [LB, Lemos, 2019]

$$C_{D} = \frac{2^{p+1}(q+p-1)(p+2)}{q-1} \frac{\Gamma(\frac{p+1}{2})}{\pi^{\frac{p+1}{2}}} \frac{\pi^{\frac{q}{2}}}{\Gamma(\frac{q}{2})} h.$$

 The relation is theory independent, but C_D and h are non-trivial functions of the parameters (e.g. λ, N).

<ロ> <四> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆</p>

Relation between C_D and h

For superconformal defects [LB, Lemos, 2019]

$$C_{D} = \frac{2^{p+1}(q+p-1)(p+2)}{q-1} \frac{\Gamma(\frac{p+1}{2})}{\pi^{\frac{p+1}{2}}} \frac{\pi^{\frac{q}{2}}}{\Gamma(\frac{q}{2})} h.$$

- The relation is theory independent, but C_D and h are non-trivial functions of the parameters (e.g. λ , N).
- Conjectured for Wilson lines in $\mathcal{N} = 4$ SYM and ABJM theory [Lewkowycz, Maldacena, 2014].
- Proven for d = 4 and any q > 1 (any SUSY) [LB, Lemos, Meineri, 2018; LB, Lemos, 2019].
- Proof is general, no conceptual difficulty in its generalization.

Examples

$$p = 1, q = 3 \qquad C_D = 36 h$$

$$p = 1, q = 2 \qquad C_D = 24 h$$

$$p = 2, q = 2 \qquad C_D = 48 h$$

비교 시민에 시민에 시민에 시민에

$$\mathcal{W} = \mathsf{Tr}\mathcal{P}e^{\mathrm{i}\oint A_{\mu}dx^{\mu}}$$

• In any conformal gauge theory, the Wilson line is a conformal defect.

$$\mathcal{W} = \mathsf{Tr}\mathcal{P}e^{\mathrm{i}\oint A_{\mu}dx^{\mu}}$$

- In any conformal gauge theory, the Wilson line is a conformal defect.
- However it breaks all the supersymmetry.

<ロ> <四> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆> <豆</p>

$$\mathcal{W} = \mathsf{Tr}\mathcal{P}e^{\mathrm{i}\oint A_{\mu}dx^{\mu}}$$

- In any conformal gauge theory, the Wilson line is a conformal defect.
- However it breaks all the supersymmetry.

Supersymmetric Wilson line for $\mathcal{N} \geq 2$ SYM

$$\mathcal{W} = \mathsf{Tr}\mathcal{P}e^{\mathrm{i}\oint A_{\mu}dx^{\mu} + \oint |dx|\phi}$$

• The presence of the scalar coupling makes the straight Wilson line $\frac{1}{2}$ BPS.

- A subsector of local operators in $\mathcal{N} = 2$ theories, when restricted to a plane and properly twisted, form a chiral algebra [Beem, Lemos, Liendo, Peelaers, Rastelli, van Rees, 2015].

- The defect identity introduces in chiral algebra a non-vacuum module $|\sigma\rangle$ [Gaiotto, Cordova, Shao, 2017]
- We worked out several non-trivial properties of this module, in particular [LB, Lemos, 2019]

$$\langle \sigma | T(z) | \sigma \rangle = -3\pi^2 \frac{h}{z^2}$$

- Identifying the module associated to the defect identity provides a way of computing *h*.
- The construction gives access to an infinite number of defect CFT data upon the identification of 4d and 2d operators.

Conclusions and open questions

- Defect correlators in CFTs are related to physically interesting observables.
- The development of exact techniques for these quantities allows us to explore the non-perturbative regime of CFTs.

Conclusions and open questions

- Defect correlators in CFTs are related to physically interesting observables.
- The development of exact techniques for these quantities allows us to explore the non-perturbative regime of CFTs.
- There are many specific questions that remain to be answered, but more generally one could ask
 - What is the landscape of conformal defects in a given bulk CFT?
 - ② Does the bulk theory determine completely the spectrum of allowed defects?
 - What are the non-trivial conformal defects one can insert in the 3d Ising model?

(日) (同) (三) (三) (三) (○) (○)

• Gauge group $U(N)_k \times U(M)_{-k}$, but here M = N.

• Integrability results depend on a coupling h, in principle non-trivially related to λ .

$$\mathcal{N} = 4 \text{ SYM} \rightarrow \lambda = (4\pi h)^2 \qquad \text{COMPUTED}$$

$$ABJM \rightarrow \lambda = \frac{\sinh^2 2\pi h}{2\pi} {}_3F_2\left(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}; 1, \frac{3}{2}; -\sinh^2 2\pi h\right) \qquad \text{CONJECTURE}$$

• There are checks of the conjecture [Gromov, Sizov, 2014] at weak [Leoni, Mauri, Minahan, Ohlsson Sax, Santambrogio, Sieg, 2010] and strong [LB, M.S.Bianchi, Bres, Forini, Vescovi,2014] Coupling

Lorenzo Bianchi (INFN)

Wilson loops in ABJM theory

• The landscape of conformal Wilson loops in ABJM is richer than $\mathcal{N} = 4$ SYM.

Scalar coupling [Drukker, Plefka, Young; Chen, Wu; Rey, Suyama, Yamaguchi, 2008]

$$W = \operatorname{Tr} \mathcal{P} e^{-i \oint A \cdot x + \oint |dx| \mathcal{M}_J^I C_I \overline{C}^J} \qquad I, J = 1, ..., 4$$

With the maximally supersymmetric coupling $\mathcal{M}_{I}^{J} = \text{diag}(-1, -1, 1, 1)$, W is $\frac{1}{6}$ BPS.

イロト イポト イヨト イヨト

Wilson loops in ABJM theory

• The landscape of conformal Wilson loops in ABJM is richer than $\mathcal{N} = 4$ SYM.

Scalar coupling [Drukker, Plefka, Young; Chen, Wu; Rey, Suyama, Yamaguchi, 2008]

$$W = \mathsf{Tr}\mathcal{P}e^{-i\oint A \cdot x + \oint |dx|\mathcal{M}_J{}^I C_I \overline{C}^J} \qquad I, J = 1, ..., 4$$

With the maximally supersymmetric coupling $\mathcal{M}_I^J = \text{diag}(-1, -1, 1, 1)$, W is $\frac{1}{6}$ BPS.

• The $\frac{1}{2}$ BPS Wilson loop is more complicated [Drukker, Trancanelli, 2010]

$$W = \frac{1}{2N} \operatorname{Tr} \left[P \exp \left(-i \int dt \mathcal{L}(t) \right) \right]$$

• In this case $\mathcal{L}(t)$ is a U(N|N) supermatrix

$$\mathcal{L} = \begin{pmatrix} A_{\mu} \dot{x}^{\mu} - i\mathcal{M}_{J}{}^{I}\mathcal{C}_{I}\bar{\mathcal{C}}^{J} & -i\eta_{I}\bar{\psi}^{I} \\ -i\psi_{I}\bar{\eta}^{I} & \hat{A}_{\mu}\dot{x}^{\mu} - i\mathcal{M}_{J}{}^{I}\bar{\mathcal{C}}^{J}\mathcal{C}_{I} \end{pmatrix}$$

There is a one-parameter family of ¹/₆BPS intermediate cases → defect conformal manifold [Cooke, Drukker, Trancanelli, 2015; Correa, Giraldo-Rivera, Silva, 2019]
