Open Questions in Neutrino Physics

- Majorana or Dirac?
- Absolute values of neutrino masses
- Hierarchy (normal $m_1 < m_2 < m_3$ or inverted $m_3 < m_1 < m_2$)
- CP-phases: δ , α_{31} and α_{21}

GUT: $SU(5)$

- * $SU(5)$, Unified picture of quarks and leptons
- * possibly leads to sizeable θ_{13}

discrete symmetry: T'

- * treats quarks and lepton mixing **simultaneously**
- * can allow spinorial unitary irreducible reps
- * “geometrical” CP violation
- * corrections to U_{TBM} via lepton sector

$$U_{\text{TBM}} = \begin{pmatrix} \sqrt{2/3} & \sqrt{1/3} & 0 \\ -\sqrt{1/6} & \sqrt{1/3} & -\sqrt{1/2} \\ -\sqrt{1/6} & \sqrt{1/3} & \sqrt{1/2} \end{pmatrix}$$

Unified model of flavour

- Model based on $SU(5) \otimes T'$
- In this model $\sin^2 \theta_{13} \cong 0.02$

Discrete symmetry: the group T'

- T' is the Double-valued group of $T \sim A_4$ (even permutations of 4 objects)
- inequivalent UIRs : $\underbrace{1, 1', 1'', 3}_\text{TBM for Neutrinos} + \underbrace{2, 2', 2''}_\text{2+1 assignments for q and \ell}$
- **Complex CG coefficients** when spinorial UIRs are involved !

Clebsch-Gordan coefficients can be **complex** \Rightarrow geometrical origin of **CP** violation!

$$\begin{pmatrix} x_1 \\ x_2 \end{pmatrix}_{2(2')} \otimes \begin{pmatrix} x'_1 \\ x'_2 \end{pmatrix}_{2(2'')} = \left(\frac{x_1 x'_2 - x_2 x'_1}{\sqrt{2}} \right)_1 \oplus \begin{pmatrix} -\frac{(1+i)}{2}(x_1 x'_2 + x_2 x'_1) \\ x_1 x'_1 \\ -ix_2 x'_2 \end{pmatrix}_3$$

$$\begin{pmatrix} x_1 \\ x_2 \end{pmatrix}_2 \otimes \begin{pmatrix} u_1 \\ u_2 \\ u_3 \end{pmatrix}_3 \sim \left[\left(\begin{pmatrix} (1+i)x_2 u_2 + x_1 u_1 \\ (1-i)x_1 u_3 - x_2 u_1 \end{pmatrix}_2 \oplus \begin{pmatrix} (1+i)x_2 u_3 + x_1 u_2 \\ (1-i)x_1 u_1 - x_2 u_2 \end{pmatrix}_{2'} \oplus \begin{pmatrix} (1+i)x_2 u_1 + x_1 u_3 \\ (1-i)x_1 u_2 - x_2 u_3 \end{pmatrix}_{2''} \right]$$

Conventions and Assignments: Matter and Higgs fields

Fundamental Symmetries	$SU(5) \otimes T'$ (SUSY!)
Shaping symmetry	$Z_{12} \otimes Z_8^3 \otimes Z_6^2 \otimes Z_4$
$U(1)_R$	Continuous version of the usual R -parity
Matter Content	10 (Q, u^c, e^c) $_L$: ten-plets into ($T1, T2$) $\sim \mathbf{2}$, $T3 \sim \mathbf{1}$
	5 (d^c, ℓ) $_L$: five-plets into ($F1, F2, F3$) $\sim \mathbf{3}$
	Three Heavy RH Majorana N_k , (N_1, N_2, N_3) $\sim \mathbf{3}$
	light active neutrinos via Type I See-Saw
	Higgs sector: copies of 5 , 5̄ and 24 assigned to 1 , 1̄

Conventions and assignments: Flavon fields

up and down quark sector $\langle \tilde{\psi}' \rangle \sim \langle \psi' \rangle \propto \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \quad \langle \tilde{\psi}'' \rangle \sim \langle \psi'' \rangle \propto \begin{pmatrix} 0 \\ 1 \end{pmatrix}$

$$\langle \tilde{\phi} \rangle \sim \langle \phi \rangle \propto \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}, \text{ singlets e.g. } \langle \tilde{\zeta}' \rangle$$

in the ν sector $\langle \xi \rangle = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \xi_0, \quad \langle \rho \rangle = \rho_0, \quad \langle \tilde{\rho} \rangle = \tilde{\rho}_0$

Flavons fields take all **real vevs** when T' is broken!

Flavon Alignment problem !!!

Flavon vacuum alignement

Auxiliary Fields: ϵ_i $SU(5) \otimes T' \sim \mathbf{1}$ and $Q_{U(1)_R} = 0$
transform in a non trivial way under
the shaping symmetries
they appear only in the flavon superpotential

$$\mathcal{W}_\epsilon = S_{\epsilon_i} (\epsilon_i^2 - M_{\epsilon_i}^2) + S_{\epsilon_j} \left(\frac{1}{\Lambda} \epsilon_j^3 - M_{\epsilon_j}^2 \right)$$

Driving Fields: $\{S_x \sim \mathbf{1}, D_x \sim \mathbf{3}\}$ $SU(5) \sim \mathbf{1}$ and $Q_{U(1)_R} = 2$
transform in a non trivial way under
 T' and shaping symmetries

for example in the neutrino sector

$$\mathcal{W}_{\xi, \rho, \tilde{\rho}} = \frac{D_\xi}{\Lambda} (\xi^2 \epsilon_9 + \xi \rho \epsilon_9 + \xi \tilde{\rho} \epsilon_9) + S_\xi (\xi^2 - M_\xi^2) + S_\rho (\rho^2 + \tilde{\rho}^2 - M_\rho^2)$$
$$\xi_i = \xi_0 \neq 0 \quad \text{if} \quad \rho_0 = -\tilde{\rho}_0$$

RL convention, i.e. $-\mathcal{L} = Y_{ij} \overline{f_R^i} f_L^j H + \text{H.c.}$

$$Y_u = \begin{pmatrix} (1-i)a_u & i b_u & 0 \\ i b_u & c_u & (1+i)d_u \\ 0 & (1+i)d_u & e_u \end{pmatrix},$$

$$Y_d = \begin{pmatrix} (1+i)a_d & i b'_d & 0 \\ (1-i)b_d & c_d & 0 \\ 0 & 0 & d_d \end{pmatrix} \quad \text{and} \quad Y_\ell = \begin{pmatrix} -\frac{3}{2}(1+i)a_d & (1-i)b_d & 0 \\ 6i b'_d & 6c_d & 0 \\ 0 & 0 & -\frac{3}{2}d_d \end{pmatrix}$$

S. Antusch, M. Spinrath arXiv:0902.4644

$$|V_{us}| \sim \left| \frac{b_d}{c_d} \right|$$

$$\theta_{12}^e \sim = \left| \frac{6ib'_d}{6c_d} \right| \sim \left| \frac{b'_d}{b_d} \right| \theta^c, \quad (b'_d = 0.9 b_d)$$

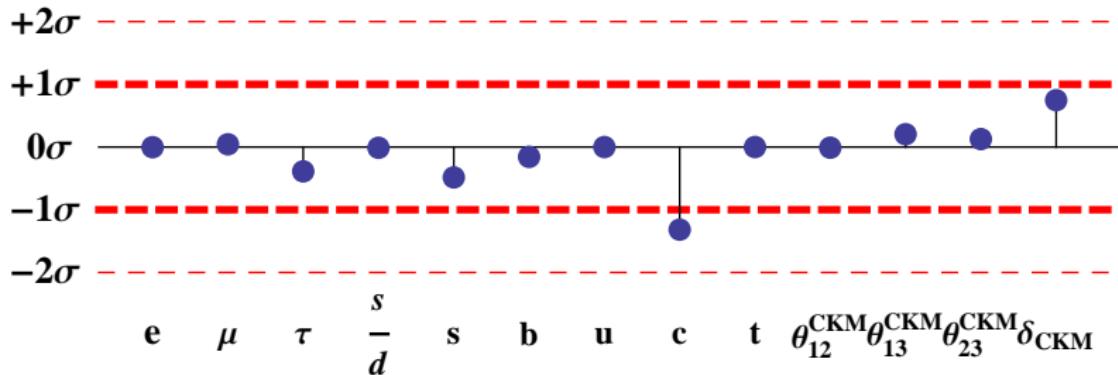

$$\theta_{13} = \frac{1}{\sqrt{2}} \theta_{12}^e = \frac{0.9}{\sqrt{2}} \theta^c$$

- We construct a unified model of flavor with large θ_{13} based on $S(5) \otimes T'$ with type I See-Saw
- T' leads to TBM in the neutrino sector + corrections coming from the charged lepton sector
- Geometrical CP violation via CGs of the T' group
 - Essential ingredient: real flavon vev alignment
- Predictions:
 - $\sin^2 \theta_{13} \sim 0.02$
 - $\delta \cong \pi/2 - 0.45\theta^c \sim 84.3^\circ$
 - Neutrino mass spectra: NO and IO possible
 - unambiguous predictions for $\beta\beta0\nu$ -Decay $|<m>|$

Thank you
