

Non-Associative Flux Algebra in String and M-theory from Octonions DIETER LÜST (LMU, MPI)

Supergravity @ 40, GGI Florence, October 27th, 2016

Donnerstag, 27. Oktober 16

Non-Associative Flux Algebra in String and M-theory from Octonions DIETER LÜST (LMU, MPI)

In collaboration with M. Günaydin & E. Malek, arXiv:1607.06474

Supergravity @ 40, GGI Florence, October 27th, 2016

Donnerstag, 27. Oktober 16

This talk is dedicated to my friend loannis Bakas

Outline:

- I) Introduction
- II) Non-associative R-flux algebra for closed strings
- III) R-flux algebra from octonions
- IV) M-theory up-lift of R-flux background
- V) Non-associative R-flux algebra in M-theory

I) Introduction

Geometry in general depends on, with what kind of objects you test it.

Point particles in classical Einstein gravity "see" continuous Riemannian manifolds.

$$- [x^i, x^j] = 0$$

Strings may see space-time in a different way.

We expect the emergence of a new kind of stringy geometry.

Closed strings in non-geometric R-flux backgrounds

 \Rightarrow non-associative phase space algebra:

$$\begin{bmatrix} x^{i}, x^{j} \end{bmatrix} = i \frac{l_{s}^{3}}{\hbar} R^{ijk} p_{k} \qquad \text{D.L, arXiv:1010.1361;} \\ \text{R. Blumenhagen, E. Plauschinn, arXiv:1010.1263.} \\ \begin{bmatrix} x^{i}, p^{j} \end{bmatrix} = i \hbar \delta^{ij}, \qquad \begin{bmatrix} p^{i}, p^{j} \end{bmatrix} = 0 \\ \implies \qquad \begin{bmatrix} x^{i}, x^{j}, x^{k} \end{bmatrix} \equiv \frac{1}{3} \begin{bmatrix} x^{1}, x^{2} \end{bmatrix}, x^{3} \end{bmatrix} + \text{cycl. perm.} = l_{s}^{3} R^{ijk}$$

Closed strings in non-geometric R-flux backgrounds

 \Rightarrow non-associative phase space algebra:

$$\begin{bmatrix} x^{i}, x^{j} \end{bmatrix} = i \frac{l_{s}^{3}}{\hbar} R^{ijk} p_{k} \qquad \text{DL., arXiv:1010.1361;} \\ \text{R. Blumenhagen, E. Plauschinn, arXiv:1010.1263.} \\ \begin{bmatrix} x^{i}, p^{j} \end{bmatrix} = i \hbar \delta^{ij}, \qquad \begin{bmatrix} p^{i}, p^{j} \end{bmatrix} = 0 \\ \implies \qquad \begin{bmatrix} x^{i}, x^{j}, x^{k} \end{bmatrix} \equiv \frac{1}{3} \begin{bmatrix} x^{1}, x^{2} \end{bmatrix}, x^{3} \end{bmatrix} + \text{cycl. perm.} = l_{s}^{3} R^{ijk}$$

This algebra can be derived from closed string CFT.

R. Blumenhagen, A. Deser, D.L., E. Plauschinn, F. Rennecke, arXiv:1106.0316

C. Condeescu, I. Florakis, D. L., arXiv: 1202.6366

D.Andriot, M. Larfors, D.L., P. Patalong:arXiv:1211.6437

C. Blair, arXiv: 1405.2283

I. Bakas, D.L., arXiv: 1505.04004

Closed strings in non-geometric R-flux backgrounds

 \Rightarrow non-associative phase space algebra:

$$\begin{bmatrix} x^{i}, x^{j} \end{bmatrix} = i \frac{l_{s}^{3}}{\hbar} R^{ijk} p_{k} \qquad \text{DL, arXiv:1010.1361;} \\ \text{R. Blumenhagen, E. Plauschinn, arXiv:1010.1263.} \\ \begin{bmatrix} x^{i}, p^{j} \end{bmatrix} = i \hbar \delta^{ij}, \qquad \begin{bmatrix} p^{i}, p^{j} \end{bmatrix} = 0 \\ \implies \qquad \begin{bmatrix} x^{i}, x^{j}, x^{k} \end{bmatrix} \equiv \frac{1}{3} \begin{bmatrix} x^{1}, x^{2} \end{bmatrix}, x^{3} \end{bmatrix} + \text{cycl. perm.} = l_{s}^{3} R^{ijk}$$

This algebra can be derived from closed string CFT.

R. Blumenhagen, A. Deser, D.L., E. Plauschinn, F. Rennecke, arXiv:1106.0316

C. Condeescu, I. Florakis, D. L., arXiv: 1202.6366

D.Andriot, M. Larfors, D.L., P. Patalong:arXiv:1211.6437

C. Blair, arXiv: 1405.2283

I. Bakas, D.L., arXiv: 1505.04004

This algebra is also closely related to double field theory.

R. Blumenhagen, M. Fuchs, F. Hassler, D.L., R. Sun, arXiv:1312.0719

On the mathematical side:

How is the R-flux algebra related to other known non-associative algebras, in particular to the algebra of the octonions?

On the mathematical side:

How is the R-flux algebra related to other known non-associative algebras, in particular to the algebra of the octonions?

On the physics side:

Can one lift the R-flux algebra of closed strings to M-theory?

On the mathematical side:

How is the R-flux algebra related to other known non-associative algebras, in particular to the algebra of the octonions?

Our conjecture:

the answers to these two questions are closely related

On the physics side:

Can one lift the R-flux algebra of closed strings to M-theory?

II) Non-geometric string flux backgrounds
 Three-dimensional string flux backgrounds:
 Chain of three T-duality transformations:

$$H_{ijk} \xrightarrow{T_i} f_{jk}^i \xrightarrow{T_j} Q_k^{ij} \xrightarrow{T_k} R^{ijk}, \quad (i, j, k = 1, \dots, 3)$$

(Hellerman, McGreevy, Williams (2002); C. Hull (2004); Shelton, Taylor, Wecht (2005); Dabholkar, Hull, 2005)

(i) T^3 with H-flux:

$$ds^{2} = (dx^{1})^{2} + (dx^{2})^{2} + (dx^{3})^{2}, \qquad B_{12} = Nx^{3}$$

H-flux:
$$H_{123} = N$$

(ii) Twisted torus tilde \tilde{T}^3 : T-duality along x^1

$$ds^{2} = (dx^{1} - Nx^{3}dx^{2})^{2} + (dx^{2})^{2} + (dx^{3})^{2}, \qquad B_{2} = 0$$

$$ilde{T}^3$$
 is a U(1) bundle over T^2 :

Globally defined 1-forms:

$$\begin{split} \eta^1 &= dx^1 - Nx^3 dx^2 \,, \qquad \eta^2 = dx^2 \,, \qquad \eta^3 = dx^3 \\ &d\eta^i = f^i_{jk} \eta^j \wedge \eta^k \\ & \text{Geometric flux:} \quad f^1_{23} = N \end{split}$$

(iii) Q-flux background: T-duality along x^2

$$ds^{2} = \frac{(dx^{1})^{2} + (dx^{2})^{2}}{1 + N^{2} (x^{3})^{2}} + (dx^{3})^{2}, \qquad B_{23} = \frac{Nx^{3}}{1 + N^{2} (x^{3})^{2}}$$

This background is globally not well defined, but it is patched together by a T-duality transformation.

 \Rightarrow T - fold C. Hull (2004)

(iii) Q-flux background: T-duality along x^2

$$ds^{2} = \frac{(dx^{1})^{2} + (dx^{2})^{2}}{1 + N^{2} (x^{3})^{2}} + (dx^{3})^{2}, \qquad B_{23} = \frac{Nx^{3}}{1 + N^{2} (x^{3})^{2}}$$

This background is globally not well defined, but it is patched together by T-duality transformation.

> \Rightarrow T - fold C. Hull (2004)

To make it well defined use double field theory:

W. Siegel (1993); C. Hull, B. Zwiebach (2009); C. Hull, O. Hohm, B. Zwiebach (2010,...)

SO(3,3) double

field theory: Coordinates: $(x^1, x^2, x^3; \tilde{x}_1, \tilde{x}_2, \tilde{x}_3)$

The dual background can then by described by ,,dual" metric and a bi-vector:

M. Grana, R. Minasian, M. Petrini, D. Waldram (2008); D. Andriot, O. Hohm, M. Larfors, D.L., P. Patalong (2011,2012); R. Blumenhagen, A. Deser, E. Plauschinn, F. Rennecke, C. Schmid (2013); D. Andriot, A. Betz (2013)

$$B_{ij}(x) \stackrel{T^{ij}}{\longleftrightarrow} \beta^{ij}(x) = \frac{1}{2} \left((g-B)^{-1} - (g+B)^{-1} \right),$$

$$g(x) \stackrel{T^{ij}}{\longleftrightarrow} \hat{g}(x) = \frac{1}{2} \left((g-B)^{-1} + (g+B)^{-1} \right)^{-1},$$

$$Q_k^{ij} = \partial_k \beta^{ij}$$

The dual background can then by described by ,,dual" metric and a bi-vector:

M. Grana, R. Minasian, M. Petrini, D. Waldram (2008); D. Andriot, O. Hohm, M. Larfors, D.L., P. Patalong (2011,2012); R. Blumenhagen, A. Deser, E. Plauschinn, F. Rennecke, C. Schmid (2013); D. Andriot, A. Betz (2013)

$$B_{ij}(x) \stackrel{T^{ij}}{\longleftrightarrow} \beta^{ij}(x) = \frac{1}{2} \left((g-B)^{-1} - (g+B)^{-1} \right),$$
$$g(x) \stackrel{T^{ij}}{\longleftrightarrow} \hat{g}(x) = \frac{1}{2} \left((g-B)^{-1} + (g+B)^{-1} \right)^{-1}$$

$$Q_k^{ij} = \partial_k \beta^{ij}$$

For the Q-flux background one obtains:

$$\hat{ds}^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2$$
, $\beta^{12} = Nx^3$
Q-flux: $Q_3^{12} = N$

Then one obtains from the CFT of the Q-flux background the following commutation relation among the coordinates:

Sigma-model for non-geometric backgrounds: A. Chatzistavrakidis, L. Jonke, O. Lechtenfeld, arXiv:1505.05457

 $|x^1, x^2| = N\tilde{p}^3$ winding number = dual momentum In general: $\left[x^{i}, x^{j}\right] = i\frac{l_{s}^{2}}{\hbar} \oint_{S^{1}} Q_{k}^{ij}(x) \ dx^{k} = i\frac{l_{s}^{3}}{\hbar} \ Q_{k}^{ij} \ \tilde{p}^{k}$

(iv) R-flux background: T-duality along x^3

Buscher rule fails and one would get a background that is even locally not well defined. Buscher rule fails and one would get a background that is even locally not well defined.

R-flux can be defined in double field theory:

$$\begin{aligned} x^k & \xleftarrow{T^k} \tilde{x}_k \\ \beta^{ij}(x^k) & \xleftarrow{T^k} \beta^{ij}(\tilde{x}_k) \\ R^{ijk} &= 3\hat{\partial}^{[k}\beta^{ij]} \end{aligned}$$

In our case we get:

$$\hat{ds}^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2 , \qquad \beta^{12} = N \tilde{x}_3$$

 R-flux: $R^{123} = N$

Strong constraint of DFT is violated by this background. But it is still a consistent CFT background. In our case we get:

$$\hat{ds}^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2$$
, $\beta^{12} = N\tilde{x}_3$
R-flux: $R^{123} = N$

Strong constraint of DFT is violated by this background. But it is still a consistent CFT background.

Now for the R-flux background we obtain:

$$\begin{bmatrix} x^{i}, x^{j} \end{bmatrix} = i \frac{l_{s}^{3}}{\hbar} R^{ijk} p_{k}$$
$$\begin{bmatrix} x^{i}, p^{j} \end{bmatrix} = i \hbar \delta^{ij}, \quad \begin{bmatrix} p^{i}, p^{j} \end{bmatrix} = 0$$
$$\implies \begin{bmatrix} x^{i}, x^{j}, x^{k} \end{bmatrix} \equiv \frac{1}{3} \begin{bmatrix} \begin{bmatrix} x^{1}, x^{2} \end{bmatrix}, x^{3} \end{bmatrix} + \text{cycl. perm.} = l_{s}^{3} R^{ijk}$$

In our case we get:

$$\hat{ds}^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2$$
, $\beta^{12} = N\tilde{x}_3$
R-flux: $R^{123} = N$

Strong constraint of DFT is violated by this background. But it is still a consistent CFT background.

Now for the R-flux background we obtain:

$$\begin{bmatrix} x^{i}, x^{j} \end{bmatrix} = i \frac{l_{s}^{3}}{\hbar} R^{ijk} p_{k} \longleftarrow \text{momentum}$$
$$\begin{bmatrix} x^{i}, p^{j} \end{bmatrix} = i \hbar \delta^{ij}, \quad \begin{bmatrix} p^{i}, p^{j} \end{bmatrix} = 0$$
$$\implies \quad \begin{bmatrix} x^{i}, x^{j}, x^{k} \end{bmatrix} \equiv \frac{1}{3} \begin{bmatrix} \begin{bmatrix} x^{1}, x^{2} \end{bmatrix}, x^{3} \end{bmatrix} + \text{cycl. perm.} = l_{s}^{3} R^{ijk}$$

Two remarks:

 Mathematical framework to describe nongeometric string backgrounds:

Group theory cohomology.

\Rightarrow 3-cycles, 2-cochains, \star - products

D. Mylonas, P. Schupp, R.Szabo, arXiv:1207.0926, arXiv:1312.162, arXiv:1402.7306. I. Bakas, D.Lüst, arXiv:1309.3172

• The same algebra appear in the context of the magnetic monopole.

R. Jackiw (1985); M. Günaydin, B. Zumino (1985)

I. Bakas, D.L., arXiv:1309.3172

III) R-flux algebra from octonions

There exist four division algebras: over $\mathbb{R}, \mathbb{C}, \mathbb{Q}, \mathbb{O}$

Division algebra of real octonions (): non-commutative, non-associative

Besides the identity, there are seven imaginary units e_A

$$e_A e_B = -\delta_{AB} + \eta_{ABC} e_C \qquad (A = 1 \dots, 7)$$

 $\eta_{ABC} = 1 \iff (ABC) = (123), (516), (624), (435), (471), (572), (673)$

Fano plane mnemonic:

Remark: Octonions generate a simple Malcev algebra

M. Günaydin, F. Gürsey (1973); M. Günaydin, D. Minic, arXiv:1304.0410.

Split indices: e_i , $e_{(i+3)} = f_i$, for i = 1, 2, 3and e_7

for i = 1, 2, 3Split indices: e_i , $e_{(i+3)} = f_i$, and e_7 $|e_i, e_j| = 2\epsilon_{ijk}e_k, \qquad |e_7, e_i| = 2f_i,$ $|f_i, f_j| = -2\epsilon_{ijk}e_k, \qquad [e_7, f_i] = -2e_i,$ $|e_i, f_j|$ $= 2\delta_{ij}e_7 - 2\epsilon_{ijk}f_k$ $[e_i, e_j, f_k] = 4\epsilon_{ijk}e_7 - 8\delta_{k[i}f_{j]},$ $= -8\delta_{i[j}e_{k]},$ $[e_i, f_j, f_k]$ $[f_i, f_j, f_k] = -4\epsilon_{ijk}e_7,$ $[e_i, e_j, e_7] = -4\epsilon_{ijk}f_k,$ $[e_i, f_j, e_7] = -4\epsilon_{ijk}e_k \,,$ $[f_{i}, f_{j}, e_{7}]$ $= 4\epsilon_{ijk}f_k$ Associator $[X, Y, Z] \equiv (XY)Z - X(YZ)$

Contraction of octonionic Malcev algebra:

$$p_i = -i\lambda \frac{1}{2}e_i$$
, $x^i = i\lambda^{1/2} \frac{\sqrt{N}}{2}f_i$, $I = i\lambda^{3/2} \frac{\sqrt{N}}{2}e_7$

Contraction of octonionic Malcev algebra:

$$p_i = -i\lambda \frac{1}{2}e_i, \qquad x^i = i\lambda^{1/2} \frac{\sqrt{N}}{2}f_i \quad , \quad I = i\lambda^{3/2} \frac{\sqrt{N}}{2}e_7$$

$$\lambda \to 0$$

$$[f_i, f_j] = -2\epsilon_{ijk}e_k \implies [x^i, x^j] = iN\epsilon^{ijk}p_k$$
$$[e_i, e_j] = 2\epsilon_{ijk}e_k \implies [p_i, p_j] = 0$$
$$[f_i, e_j] = -\delta^i_j e_7 + \epsilon^i_{jk}f_k \implies [x^i, p_j] = i\delta^i_j I$$
$$[x_i, I] = 0 = [p_i, I]$$
$$[f_i, f_j, f_k] = -4\epsilon_{ijk}e_7 \implies [x^i, x^j, x^k] = N\epsilon^{ijk}I$$

Agrees with non-associative R-flux algebra !

- e^7 additional M-theory coordinate
 - \Rightarrow Four coordinates: f_1, f_2, f_3, e_7

- e^7 additional M-theory coordinate
 - \Rightarrow Four coordinates: f_1, f_2, f_3, e_7
- but no additional momentum.
 - \Rightarrow Three momenta: e_1, e_2, e_3

- e^7 additional M-theory coordinate
 - \Rightarrow Four coordinates: f_1, f_2, f_3, e_7
- but no additional momentum.
 - \Rightarrow Three momenta: e_1, e_2, e_3
- \Rightarrow Seven dimensional phase space !

Lift of R-flux algebra to non-geometric M-theory background:

- e^7 additional M-theory coordinate
 - \Rightarrow Four coordinates: f_1, f_2, f_3, e_7
- but no additional momentum.
 - \Rightarrow Three momenta: e_1, e_2, e_3

⇒ Seven dimensional phase space !

Will be closely related to SL(4) /SO(4) exceptional field theory.

IV) M-theory up-lift of R-flux background

Consider IIA string: the duality chain splits into two possible T-dualities:

$$H_{ijk} \xrightarrow{T_{ij}} Q_k^{ij}, \qquad f_{jk}^i \xrightarrow{T_{jk}} R^{ijk}$$

IV) M-theory up-lift of R-flux background

Consider IIA string: the duality chain splits into two possible T-dualities:

 $H_{ijk} \xrightarrow{T_{ij}} Q_k^{ij}, \qquad f_{jk}^i \xrightarrow{T_{jk}} R^{ijk}$

IV) M-theory up-lift of R-flux background

Consider IIA string: the duality chain splits into two possible T-dualities:

$$H_{ijk} \xrightarrow{T_{ij}} Q_k^{ij}, \qquad f_{jk}^i \xrightarrow{T_{jk}} R^{ijk}$$

Uplift to M-theory: add additional circle $S_{x^4}^1$

• 3-dim IIA flux background ⇔ 4-dim M-theory flux

background

• two T-dualities ↔ 3 U-dualities

(Need third duality along the M-theory circle to ensure right dilaton shift.)

(i) twisted torus $\tilde{T}^3 \times S^1_{x^4}$ $ds_4^2 = (dx^1 - Nx^3 dx^2)^2 + (dx^2)^2 + (dx^3)^2 + (dx^4)^2, \qquad C_3 = 0$

(i) twisted torus $\tilde{T}^3 \times S_{x^4}^1$ $ds_4^2 = (dx^1 - Nx^3 dx^2)^2 + (dx^2)^2 + (dx^3)^2 + (dx^4)^2$, $C_3 = 0$ (ii) R-flux background: dualise along x^2, x^3 and x^4 . This leads to a locally not well defined space.

(i) twisted torus $\tilde{T}^3 \times S^1_{r^4}$ $ds_4^2 = (dx^1 - Nx^3 dx^2)^2 + (dx^2)^2 + (dx^3)^2 + (dx^4)^2, \qquad C_3 = 0$ (ii) R-flux background: dualise along x^2, x^3 and x^4 . This leads to a locally not well defined space. Use SL(5) exceptional field theory: D. Berman, M. Perry, arXiv:1008.1763 **10** generalized coordinates: $x^A \leftrightarrow x^{\lfloor ab \rfloor} \quad (A = 1, \dots, 10; a, b = 1, \dots, 5)$ • 4 coordinates of T^4 : $x^{\alpha} = x^{5\alpha}$, $(\alpha = 1, \dots, 4)$ • 6 dual coordinates: $(\tilde{x}^{41}, \tilde{x}^{42}, \tilde{x}^{43}; \tilde{x}^{21}, \tilde{x}^{31}, \tilde{x}^{32})$ wrapped FI wrapped D2

(i) twisted torus
$$\tilde{T}^3 \times S_{x^4}^1$$

 $ds_4^2 = (dx^1 - Nx^3 dx^2)^2 + (dx^2)^2 + (dx^3)^2 + (dx^4)^2$, $C_3 = 0$
(ii) R-flux background: dualise along x^2, x^3 and x^4 .
This leads to a locally not well defined space.
Use SL(5) exceptional field the result of SL(5) remains and x^{4} .
10 generalized coordinates:
 $x^A \leftrightarrow x^{[ab]}$ $(A = 1, \dots, 10; a, b = 1, \dots, 5)$
• 4 coordinates of $T^4: x^{\alpha} = x^{5\alpha}$, $(\alpha = 1, \dots, 4)$
• 6 dual coordinates: $(\tilde{x}^{41}, \tilde{x}^{42}, \tilde{x}^{43}; \tilde{x}^{21}, \tilde{x}^{31}, \tilde{x}^{32})$
wrapped FI wrapped D2

Donnerstag, 27. Oktober 16

dual metric: $\hat{g}_{\alpha\beta} = (1+V^2)^{-1/3} [(1+V^2) g_{\alpha\beta} - V_{\alpha} V_{\beta}]$ tri-vector: $\Omega^{\alpha\beta\gamma} = (1+V^2)^{-1} g^{\alpha\rho} g^{\beta\sigma} g^{\gamma\delta} C_{\rho\sigma\delta}$, $\hat{ds}_7^2 = \left(1 + V^2\right)^{-1/3} ds_7^2.$ $V^{\alpha} = \frac{1}{3!|e|} \epsilon^{\alpha\beta\gamma\delta} C_{\beta\gamma\delta}$ $B^{\alpha,\beta\gamma\delta\rho} = 4\hat{\partial}^{\alpha[\beta}\Omega^{\gamma\delta\rho]}$ **R-flux:** $\hat{\partial}^{\alpha\beta} = \partial^{\alpha\beta} + \Omega^{\alpha\beta\gamma}\partial_{\gamma}$, $\partial^{\alpha\beta} = \frac{\partial}{\partial r^{\alpha\beta}}$

dual metric: $\hat{g}_{\alpha\beta} = (1+V^2)^{-1/3} [(1+V^2) g_{\alpha\beta} - V_{\alpha} V_{\beta}]$ tri-vector: $\Omega^{\alpha\beta\gamma} = (1+V^2)^{-1} g^{\alpha\rho} g^{\beta\sigma} g^{\gamma\delta} C_{\rho\sigma\delta}$, $\hat{ds}_7^2 = (1+V^2)^{-1/3} ds_7^2.$ $V^{\alpha} = \frac{1}{3!|e|} \epsilon^{\alpha\beta\gamma\delta} C_{\beta\gamma\delta}$ $B^{\alpha,\beta\gamma\delta\rho} = 4\hat{\partial}^{\alpha[\beta}\Omega^{\gamma\delta\rho]}$ **R-flux:** $\hat{\partial}^{\alpha\beta} = \partial^{\alpha\beta} + \Omega^{\alpha\beta\gamma}\partial_{\gamma}$, $\partial^{\alpha\beta} = \frac{\partial}{\partial r^{\alpha\beta}}$ A particular choice of R-flux breaks SL(5) to SO(4).

In this way we obtain a well defined R-flux background in M-theory, which is dual to twisted torus:

$$\hat{ds}_7^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2 + (dx^4)^2, \qquad \Omega^{134} = N\tilde{x}^{24}$$

$$R^{4,1234} = N$$

The R-flux breaks the section condition of exceptional field theory.

But it should be still a consistent M-theory background.

Four coordinates:

$$x^1, x^2, x^3, x^4$$

What are the possible conjugate momenta (or windings)?

Four coordinates:

$$x^1, x^2, x^3, x^4$$

What are the possible conjugate momenta (or windings)?

• Consider cohomology of twisted torus:

$$H^1(\tilde{T}^3 \times S^1, \mathbb{R}) = \mathbb{R}^3$$

Four coordinates: x^1, x^2, x^3, x^4

What are the possible conjugate momenta (or windings)?

Consider cohomology of twisted torus:

$$H^1(\tilde{T}^3 \times S^1, \mathbb{R}) = \mathbb{R}^3$$

Alternatively consider Freed-Witten anomaly: x^4 **R-Flux with momentum** p_4 along $\hat{\mathbf{I}}$ R-Flux with D0 branes. Dualize to IIB: H-flux with D3-branes This is forbidden by the Freed-Witten anomaly. \Rightarrow No momentum modes along the x^4 direction !

So we see that the phase space space of R-flux background in M-theory is seven-dimensional:

$$x^1, x^2, x^3, x^4; p_1, p_2, p_3$$

So we see that the phase space space of R-flux background in M-theory is seven-dimensional:

 $x^1, x^2, x^3, x^4; p_1, p_2, p_3$

So we see that the phase space space of R-flux background in M-theory is seven-dimensional:

$$x^1, x^2, x^3, x^4; p_1, p_2, p_3$$

Missing momentum condition in covariant terms:

$$p_{\alpha}R^{\alpha,\beta\gamma\delta\rho} = 0$$

This condition is not the same as section condition.

V) Non-associative R-flux algebra in M-theory

Identify

$$X^{i} = \frac{1}{2}i\sqrt{N}l_{s}^{3/2}\lambda^{1/2}f_{i}, \qquad X^{4} = \frac{1}{2}i\sqrt{N}l_{s}^{3/2}\lambda^{3/2}e_{7}, \qquad P^{i} = -\frac{1}{2}i\hbar\lambda e_{i}$$

V) Non-associative R-flux algebra in M-theory Identify $X^{i} = \frac{1}{2}i\sqrt{N}l_{s}^{3/2}\lambda^{1/2}f_{i}, \qquad X^{4} = \frac{1}{2}i\sqrt{N}l_{s}^{3/2}\lambda^{3/2}e_{7}, \qquad P^{i} = -\frac{1}{2}i\hbar\lambda e_{i}$

Octonionic algebra = conjectured M-theory algebra

$$\begin{split} & [P_i,P_j] &= -i\lambda\hbar\epsilon_{ijk}P^k \,, \qquad \begin{bmatrix} X^4,P_i \end{bmatrix} = i\lambda^2\hbar X_i \,, \\ & \begin{bmatrix} X^i,X^j \end{bmatrix} &= \frac{il_s^3}{\hbar}R^{4,ijk4}P_k \,, \qquad \begin{bmatrix} X^4,X^i \end{bmatrix} = \frac{i\lambda l_s^3}{\hbar}R^{4,1234}P^i \,, \\ & \begin{bmatrix} X^i,P_j \end{bmatrix} &= i\hbar\delta_j^iX^4 + i\lambda\hbar\epsilon^i{}_{jk}X^k \,, \\ & \begin{bmatrix} X^\alpha,X^\beta,X^\gamma \end{bmatrix} &= l_s^3R^{4,\alpha\beta\gamma\delta}X_\delta \,, \\ & \begin{bmatrix} P_i,X^j,X^k \end{bmatrix} &= 2\lambda l_s^3R^{4,1234}\delta_i^{[j}P^{k]} \,, \\ & \begin{bmatrix} P^i,X^j,X^4 \end{bmatrix} &= \lambda^2 l_s^3R^{4,ijk4}P_k \,, \\ & \begin{bmatrix} P_i,P_j,X_k \end{bmatrix} &= -\lambda^2\hbar^2\epsilon_{ijk}X^4 + 2\lambda\hbar^2\delta_{k[i}X_{j]} \,, \\ & \begin{bmatrix} P_i,P_j,X_4 \end{bmatrix} &= \lambda^3\hbar^2\epsilon_{ijk}X_k \,, \\ & \begin{bmatrix} P_i,P_j,P_k \end{bmatrix} &= 0 \,. \end{split}$$

Natural identification of contraction parameter λ : \Rightarrow String coupling g_s : $\lambda \propto g_s \propto R_4$

Natural identification of contraction parameter λ : \Rightarrow String coupling g_s : $\lambda \propto g_s \propto R_4$ The non-associative M-theory algebra is not SL(5) invariant. However the algebra is SO(4) invariant:

$$X^{lpha}$$
 : $(2,2)$ of $SU(2,2)$
 P_i : $(3,1)$ of $SU(2,2)$
Lie subalgebra $[P_i,P_j]=-i\lambda\hbar\epsilon_{ijk}P^k$

Natural identification of contraction parameter λ :

- \Rightarrow String coupling g_s : $\lambda \propto g_s \propto R_4$
- The non-associative M-theory algebra is not SL(5) invariant. However the algebra is SO(4) invariant:

$$X^{lpha}$$
 : $(2,2)$ of $SU(2,2)$
 P_i : $(3,1)$ of $SU(2,2)$
Lie subalgebra $[P_i,P_j]=-i\lambda\hbar\epsilon_{ijk}P^k$

Further Modification compared to the string case:

$$\left[X^{i}, P_{j}\right] = i\hbar\delta^{i}_{j}X^{4} + i\lambda\hbar\epsilon^{i}_{jk}X^{k}$$

V) Outlook & open questions

Non-associative algebras occur in M-theory at many places:

- Multiple M2-brane theories and 3-algebras

J. Bagger, N. Lambert (2007)

- $Spin(7), G_2$ backgrounds

I.Bakas, E. Floratos, A. Kehagias, hep-th/9810042
